Getting Started Guide

Literature Number: SPRUF88E
April 2009
IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for such any statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or “enhanced plastic.” Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.

EVALUATION BOARD/KIT IMPORTANT NOTICE

Texas Instruments (TI) provides the enclosed product(s) under the following conditions:

This evaluation board/kit is intended for use for ENGINEERING DEVELOPMENT, DEMONSTRATION, OR EVALUATION PURPOSES ONLY and is not considered by TI to be a finished end-product fit for general consumer use. Persons handling the product(s) must have electronics training and observe good engineering practice standards. As such, the goods being provided are not intended to be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including product safety and environmental measures typically found in end products that incorporate such semiconductor components or circuit boards. This evaluation board/kit does not fall within the scope of the European Union directives regarding electromagnetic compatibility, restricted substances (RoHS), recycling (WEEE), FCC, CE or UL, and therefore may not meet the technical requirements of these directives or other related directives.

Should this evaluation board/kit not meet the specifications indicated in the User's Guide, the board/kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user indemnifies TI from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge.

EXCEPT TO THE EXTENT OF THE INDEMNITY SET FORTH ABOVE, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

TI currently deals with a variety of customers for products, and therefore our arrangement with the user is not exclusive.

TI assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein.

Please read the User's Guide and, specifically, the Warnings and Restrictions notice in the User's Guide prior to handling the product. This notice contains important safety information about temperatures and voltages. For additional information on TI's environmental and/or safety programs, please contact the TI application engineer or visit www.ti.com/esh.

No license is granted under any patent right or other intellectual property right of TI covering or relating to any machine, process, or combination in which such TI products or services might be or are used.

FCC Warning

This evaluation board/kit is intended for use for ENGINEERING DEVELOPMENT, DEMONSTRATION, OR EVALUATION PURPOSES ONLY and is not considered by TI to be a finished end-product fit for general consumer use. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.
Preface

About This Guide

The DVEVM (Digital Video Evaluation Module) kit is an evaluation platform that showcases the DM646x architecture and lets users evaluate the power and performance of the DM646x as a multimedia engine.

This guide gives you overview information about the board and the software provided with the board. It is intended to be used as an introductory document for the DVEVM. Other documents provide more in-depth information. See the DVEVM release notes for a complete list of documents that have been included with the product.

Additional Documents and Resources

You can use the following sources to supplement this user’s guide:

- LSP 2.0 DaVinci Linux EVM Installation User’s Guide (SPRUG94)
- Spectrum Digital website: http://support.spectrumdigital.com/boards/evmdm6467
- TI Linux Community for DaVinci Processors: http://linux.davincidsp.com
- TI DaVinci Software Updates: http://www.ti.com/dvevmupdates
- TI DaVinci Technology Developers Wiki: http://wiki.davincidsp.com
- Codec Engine Application Developer’s Guide (SPRU67)
- Other PDF documents included with the DVEVM kit
- Section 4.12 lists documentation in the DVSDK software installation.
- SoC Analyzer Help menu
Notational Conventions

This document uses the following conventions:

- Program listings, program examples, and interactive displays are shown in a mono-spaced font. Examples use **bold** for emphasis, and interactive displays use **bold** to distinguish commands that you enter from items that the system displays (such as prompts, command output, error messages, etc.).

- Square brackets ([ and ]) identify an optional parameter. If you use an optional parameter, you specify the information within the brackets. Unless the square brackets are in a **bold** typeface, do not enter the brackets themselves.

Trademarks

The Texas Instruments logo and Texas Instruments are registered trademarks of Texas Instruments. Trademarks of Texas Instruments include: TI, DaVinci, the DaVinci logo, XDS, Code Composer, Code Composer Studio, Probe Point, Code Explorer, DSP/BIOS, RTDX, Online DSP Lab, DaVinci, TMS320, TMS320C54x, TMS320C55x, TMS320C62x, TMS320C64x, TMS320C67x, TMS320C5000, and TMS320C6000.

MS-DOS, Windows, and Windows NT are trademarks of Microsoft Corporation.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Linux is a registered trademark of Linus Torvalds.

Solaris, SunOS, and Java are trademarks or registered trademarks of Sun Microsystems, Inc.

All other brand, product names, and service names are trademarks or registered trademarks of their respective companies or organizations.

1.1 Welcome!

Your new DVEVM (Digital Video Evaluation Module) kit will allow you to evaluate TI’s new DaVinci™ Technology and the DM646x architecture.

This technology brings together system-solution components tailored for efficient and compelling digital video and audio.

1.2 What’s in this Kit?

A DVEVM (DaVinci Evaluation Module) is a physical kit that includes the DVSDK software bundle, a demonstration version of MontaVista Linux Pro, the EVM board, and other hardware items. The DVSDK (DaVinci Software Development Kit) software bundle contained in a DVEVM includes such products as DSP/BIOS, Codec Engine, Link, DVTB, and demo applications. If you upgrade to the fully licensed version of MontaVista Linux Pro, the kit that contains the full set of MV Pro disks and a MV license is called a DVSPB (DaVinci Software Product Bundle).

Your DVEVM kit contains the following hardware items. Section 2.1, Setting Up the Hardware tells how to connect these components.

- **EVM Board.** This board contains a DaVinci TMS320DM6467 dual-core device with an ARM9 and C64+ DSP for development of applications that use both a general-purpose processor and an accelerated DSP processor.

- **Hard Disk Drive.** The hard drive provided with the EVM is a 2.5" Spinpoint drive with 40 GB of storage. The drive speed is 5400 RPM and it has an 8MB cache. The drive is an Ultra ATA 66/100/133 IDE. Software has been preloaded on this EVM board’s hard disk drive.

- **IR Remote Control.** This universal remote control is included to provide a user interface to the demo applications.

- **Cables.** Cables used to connect the EVM board to peripheral devices and to a host Linux workstation used for development are provided in the kit.
The DVEVM kit also comes with the following software. Information about how to use the software components is provided in Chapter 4.

- DaVinci Digital Video Evaluation Kit.
- TI DaVinci Demonstration Version of MontaVista Linux Pro v5.0 Target
- TI DaVinci Demonstration Version of MontaVista Linux Pro v5.0 Tools
- A/V Media Clips
- Spectrum Digital EVM Tools
- SoC Analyzer

1.3 What’s on the Board?

The EVM comes loaded with peripherals your multimedia applications may need to make use of. The hard drive on the board also comes pre-loaded with demonstration software. The following block diagram shows the major hardware components.

*Figure 1-1  EVM Hardware Block Diagram*

For more information about the EVM hardware, see the DaVinci EVM website at http://support.spectrumdigital.com/boards/evmdm6467.
1.4 Registering the Software and Downloading Updates

To download software updates and to register to receive notifications about future updates, follow these steps:

   - If you do not already have a my.TI login and password, you will be asked to create one. (Click **Sign Up** on the my.TI login page.)
   - After you sign up, you should always use the same e-mail address you entered to log in to myRegistered Software.

2) After logging in, enter your TI Software Activation ID, which is on the software DVD case, and follow the screens.

3) After you activate the software, go to myRegistered Software at http://www.ti.com/myregisteredsoftware.

4) Find your software product.

5) Click the **MANAGE** button, and click **Get Updates**. In addition to software updates, you can download PDF documents about the software.

1.5 What’s Next?

To get started evaluating the DVEVM kit and developing applications for the DM646x, begin by using this Getting Started guide. It will step you through connecting the hardware, testing the software, and beginning to develop applications.

When you are ready for more information about DaVinci Technology and the DM646x architecture, see the following:

- **LSP 2.0 DaVinci Linux EVM Installation User’s Guide** (SPRUG94)
- Spectrum Digital website: http://support.spectrumdigital.com/boards/evmdm6467
- TI Linux Community for DaVinci Processors: http://linux.davincidsp.com
- TI DaVinci Software Updates: http://www.ti.com/dvevmupdates
- TI DaVinci Technology Developers Wiki: http://wiki.davincidsp.com
- **Codec Engine Application Developer’s Guide** (SPRUE67)
- Other PDF documents included with the DVEVM kit
- Section 4.12 lists documentation in the DVSDK software installation.
- SoC Analyzer Help menu
This chapter tells you how to set up the EVM hardware.

<table>

<td>2–7</td>
</tr>
</tbody>
</table>
2.1 Setting Up the Hardware

To set up the hardware provided with the EVM, use the steps in the sections that follow. You may skip sections if you do not need to access a particular peripheral. For example, if you do not need to use the serial cable, skip that section.

1) The EVM is sensitive to static discharges. Use a grounding strap or other device to prevent damaging the board.

   Be sure to connect communication cables before applying power to any equipment.

2) Verify that the EVM board’s EMU0/1 select switch (S1) is set correctly. The settings shown here enable both ARM and DSP JTAG for emulation debugging.
Setting Up the Hardware

3) Verify that the EVM board’s SW3 boot/muxing configuration switch is correctly set. The BM1, BM2, and BM3 switches should be set to On. These switch settings, which are shown in the following figure, enable the following:

- SPI boot mode
- EMI F A is 8-bit data bus for CS2
- PCI pin multiplexing enabled on DM6467
- DSP is booted via ARM processor

4) Connect the Ethernet cable to the Ethernet port on the EVM board and to an Ethernet network port. Note that the U-Boot bootargs must include "ip= dhcp" to enable the network connection.
5) Connect a video source (for example, a camera or DVD player) to the component input video connectors (J1, J2, J3). Note: To run the demos described in Chapter 3, you will need to have an HD (720p) video source connected to the EVM board's component input connectors.

6) Connect your video display to the EVM board’s component output video connectors (J10, J11 and J12) using the component cables included with the DVEVM kit. Note: To run the demos described in Chapter 3, you will need to have an HD display connected to the EVM board's component output connectors.
7) Connect an audio speaker to the headphone connector (P4).

8) Connect an audio source to the microphone connector (P8).
9) If you plan to use the UART port for a console window, connect the RS-232 null modem cable to the EVM UART port (P1) and to the COM port of your host workstation.

10) Power on your video input and output devices.

11) Connect the power cable to the EVM power jack on the board. To be ESD safe, plug in the other end of the power cable only after you have connected the power cord to the board. Then turn on the board.

12) The initial screen of the demo software should be displayed on your video output device. Use the IR remote to run the software as described in Chapter 3.
2.2 Connecting to a Console Window

You can open a console window that allows you to watch and interrupt EVM boot messages by following these steps:

1) Connect a serial cable between the serial port on the EVM and the serial port (for example, COM1) on a PC.

2) Run a terminal session (such as Minicom on Linux or HyperTerminal on Windows) on the workstation and configure it to connect to that serial port with the following characteristics:
   - Bits per Second: 115200
   - Data Bits: 8
   - Parity: None
   - Stop Bits: 1
   - Flow Control: None

3) When you power on the EVM, you will see boot sequence messages. You can press a key to interrupt the boot sequence and type commands in the U-Boot command shell. In this guide, commands to be typed in the U-Boot shell are indicated by an EVM # prompt.
This chapter explains how to run the software demos provided with the DVEVM kit.

</tr>
</tbody>
</table>
3.1 Default Boot Configuration

Out of the box, the EVM boots from flash and starts the demos automatically after a few seconds when you power up the board. It does not require an NFS mount or a TFTP server to run the standard demos.

Note: The default U-Boot bootargs definition sets "ip=off", which disables the Ethernet connection.

The out-of-the-box boot parameters are listed in Section A.3.1. The following are alternate ways you may want to boot the board:

- TFTP boot with hard drive file system (Section A.3.2)
- Flash boot with NFS file system (Section A.3.3)
- TFTP boot with NFS file system (Section A.3.4)

To abort the standard boot, press any key in the console window (see Section 2.2). Also see Section A.3, Alternate Boot Methods if you want to change the boot configuration.

3.2 Starting the Standalone Demos

When you connect the EVM hardware, the pre-loaded examples run automatically on the display connected to the EVM board's component output connectors, using a 720p (HD) video source connected to the component input connectors. These examples encode and decode audio, video, and speech. There are two ways to use the demos:

- Standalone. This is the default power-on mode. The demos run automatically with no connection to a workstation in the default boot configuration. This is the mode documented in the rest of this chapter.

  The standalone demo was set up by the placing the dvevmdemo file in the examples/dm6467 directory of the dvsdk directory /etc/rc.d/init.d (the central repository for startup scripts) of the target file system. This file is symbolically linked to /etc/rc.d/rc3.d/S88demo. When the board boots up and enters runlevel 3, this file is executed to start the demo web server and the demo interface.

- Command line. Once you have connected the EVM to a workstation and installed the necessary software (as described in Section 4.3.1, Installing the Target Linux Software), you can run the demos from the board's Linux command line. For further information on running the demos from the command line, see the demo documentation that is linked to by the DVSDK release notes.

Note: When you run the demos from the command line, make sure the interface process used by the standalone mode demos is not
Starting the Standalone Demos

Running the Demonstration Software

running. Otherwise you will see error messages raised when device drivers fail to open.

Once the EVM board has booted, the display should show a picture of the remote control. You use the IR remote to control the demos.

The order of the buttons on the actual remote may be different from the picture; if your remote looks different, find the buttons with the same labels on your remote.

To use the demos in standalone mode, follow these steps:

1) Check to make sure the batteries are installed in your IR remote.

2) Make sure an HD (720p) video source is connected to the EVM board’s component input connectors. Also make sure an HD display is connected to the EVM board’s component output connectors.

Note: The demos do not currently support composite video output.

3) The initial screen shows a diagram of the IR remote, which you use to run the standalone demos. Take a minute to look at the functions of the various buttons.

4) Since this is a universal remote, you may need to set it to use the codes necessary to run the DVEVM demos. To do this, hold down the “Code Search” button until the red light on the remote stays lit. Then press the “DVD” button and enter "0020" as the code.

5) If you accidentally put the remote in TV or some other mode, press "DVD" to return the remote to the correct mode.

6) If the remote does not accept the DVD+0020 code, do a full reset by removing the batteries, pressing the Power button for at least a minute, then reinserting the batteries. Then program the remote as in Step 3.
3.3 Running the Standalone Demos

1) Press "Play" or "OK" on the remote to move from the remote control diagram to the main menu screen, which looks like this:

![Remote control menu](image)

The Encode + Decode demo allows you to record and playback video. The Encode demo records audio/speech and video in the formats you select. The Decode demo plays audio/speech and video files you select. The Third-Party Menu can be used to add additional demos (see Section A.1, Putting Demo Applications in the Third-Party Menu).

2) Use the up and down arrows to change which demo is selected. Then, press "OK" or "Play" to move to the selected demo.

3) Within a demo, you start at the settings screen, where you see the controls you can use to run the demo at the bottom of the screen and the current settings in the upper-right.

For example, the Encode demo allows you to set the video format and the bit rate at which video should be encoded. Fixed settings are also shown here.

4) Use the up and down arrows to move to a setting you want to change.
5) Use the left and right arrows to cycle through the options until the setting you want is shown.

6) Press "Play" to begin the Encode+Decode and Decode demos. Press "Rec" (record) twice to begin the Encode demo.

7) While the demo runs, data about the settings, processor load, and rates are shown. Static settings are on the right. Dynamic data reporting is on the left. For example:

   ARM CPU load: 7%  Encode
   DSP CPU load: 89%  H.264 BP Video
   Video frame rate: 30 fps  G.711 Speech
   Video bit rate: 4050 kbps  D1 (720x480)
   Audio bit rate: 61 kbps  NTSC display
   Time elapsed: 00:00:24  8KHz samp rate

8) This information overlays the video; as a result the video you see is darker than the actual video. To hide the information display so that you can better see the video, press the "Info/Select" button on the IR remote. You can change the transparency of the OSD (overlay) while running a demo by using the left and right arrows on the remote.

9) Press "Stop" or "Pause" when you want to end or pause a demo. The first time you press "Stop", you return to the settings screen. Press "Stop" from the settings screen to go back to the main menu.

For information about running the individual demos, see Section 3.3.2 through Section 3.3.4.

The demos use the Codec Engine to allow applications to run algorithms.

You may notice that the DSP CPU load is initially high, even if the DSP is not running algorithms. The CPU load starts at 100% while the DSP is booting and then decreases while the DSP waits for work to be requested by the GPP. Even if DSP is idle, it may take a short amount of time (several seconds) for the CPU load to settle to zero. This is because the Codec Engine’s CPU load calculation includes a small amount of history.

### 3.3.1 Shutting Down the Demos

You can quit out of the demos completely while at the main menu screen by pressing "Power" on the remote.

To restart the demos, you can reboot the board or run the demos from the command line as described in Section 3.4.
3.3.2 About the Encode + Decode Demo

The Encode + Decode demo allows you to record and playback video from an HD video source connected to the EVM board's component input connectors, is encoded, then decoded, and then sent to a display connected to the EVM board's component video output connectors.

*Note:* The Encode + Decode demo inputs HD video and outputs standard video—not HD (720p) video. Since HD displays accept standard video input, you should not need to modify your hardware setup to run this demo.

The Encode + Decode does only video processing; it does not encode and decode audio or speech. The supported video algorithm is H.264 Baseline Profile (.264 file extension).

### Table 3–1 IR Remote Buttons for Encode + Decode Demo

<table>
<thead>
<tr>
<th>IR Remote Button</th>
<th>Mode</th>
<th>Action Performed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up/Down</td>
<td>--</td>
<td>-- no action --</td>

<td>Run</td>
<td>Pause demo (press Play to resume)</td>
</tr>
<tr>
<td>Stop</td>
<td>Setup / Run</td>
<td>Return to previous screen</td>
</tr>
</tbody>
</table>
The application runs on the ARM using Linux. The video signal is passed to video encoders and decoders on the DSP by the Codec Engine. Shared memory is used when passing data.

To use this demo from the command line, see Section 3.4, *Running the Demos from the Command Line*.

### 3.3.3 About the Encode Demo

Like the Encode + Decode demo, the Encode demo also encodes 720p video. In addition, it also encodes audio or speech. The audio/speech source is the microphone.

The encoded data is written to files on the EVM’s hard disk drive. The possible filenames are `demo_g711.264`, `demo_aac.264`, `demo.aac`, and `demo.g711`. Older versions of these files are overwritten as needed.

Output is not decoded and sent to the display or speakers other than to show the settings and dynamic data collected about the load and rates.
The supported video algorithm is H.264 (.264 file extension). The supported speech algorithm is G.711 (.g711 extension). The supported audio algorithm is AAC (.aac extension).

<td>Setup / Run</td>
<td>Return to previous screen</td>
</tr>
</tbody>
</table>

In setup mode, use the arrow buttons on the remote to adjust the settings for the video bit rate and audio format. The video codec selection and the audio bit rate are not modifiable.

The application runs on the ARM using Linux. The video and audio signals are passed to encoders on the DSP by the Codec Engine. Shared memory is used when passing data.

To use this demo from the command line, see Section 3.4, Running the Demos from the Command Line.
3.3.4 About the Decode Demo

The Decode demo plays audio/speech and video files you select. You can select a source video file and a source audio or speech file. Use the left and right arrow buttons to choose from the demo files and the files created by the Encode demo, which are stored on the EVM's hard disk drive. The decoded signals are sent to an HD display connected to the EVM board's component video output connectors.

The supported video algorithms are H.264 (.264 file extension) and MPEG2 (.m2v file extension).

The supported audio algorithm is AAC (.aac file extension). The supported speech algorithm is G.711 (.g711 file extension).

</table>
The application runs on the ARM using Linux. The video and audio signals are passed to decoders on the DSP by the Codec Engine. Shared memory is used when passing data.

To use this demo from the command line, see Section 3.4, *Running the Demos from the Command Line*.

### 3.3.5 About the Third Party Menu

The Third-Party Menu can be used to add additional demos. See Section A.1, *Putting Demo Applications in the Third-Party Menu*.

### 3.4 Running the Demos from the Command Line

Once you have connected the EVM to a workstation and installed the necessary software (as described in Section 4.3.1, *Installing the Target Linux Software*), you can run the demo applications from the Linux shell in a terminal window connected to the EVM board’s serial port. These are the same demos described in Section 3.2, *Starting the Standalone Demos*.

1) See Section 2.2, *Connecting to a Console Window* for instructions regarding communicating with Linux running on the EVM.

2) Login to the target as root. No password is required.

3) Move to the appropriate directory on the target using the following command. (See Section 4.1.1 for the meanings of command prompts shown in this document.)

```
Target $ cd /opt/dvsdk/dm6467
```
Running the Demos from the Command Line

4) Before running demo applications from the command line, the CMEM and accelerator kernel modules must be loaded.

- Use "lsmod" to see if they are loaded. You should see output similar to the following:

```
Target $ lsmod
Module           Size      Used by
    dsplinkk         98220        0
    cmemk            20072        0
```

- If they are not loaded, use the following commands to load these modules.

```
Target $ ./loadmodules.sh
```

5) If a standalone demo is running, kill that process. You can do this by pressing the Power button on the remote from the main menu. Or, use the following commands:

```
Target $ killall -9 interface
```

6) To see the command-line options for the demos, use one of the following commands with the -h or --help option:

```
Target $ ./encodedecode -h
Target $ ./encode -h
Target $ ./decode -h
```

7) To stop a demo, press Ctrl+C at the command line or press the Stop button on the remote.

You can also find the list of command-line options in encode.txt, decode.txt, and encodedecode.txt in the respective demo directories of the DVSDK package on the host.

**Note:** When you run loadmodules.sh, you may see warnings about the kernel being tainted by cmemk and dsplinkk. You can ignore these warnings. They occur because DSP/BIOS Link does not use the kernel build system and is not under the same license as the kernel itself.
3.5 Running the Network Demo

As an example of standard TCP/IP networking support, the DVEVM examples include a small HTTP web server. This web server is started on the GPP-side as part of the Linux startup sequence. It configured to service requests from web browsers on the standard TCP/IP port 80.

See Step 4 of Section 2.1 for the hardware setup required for networking.

After the EVM board has booted, connect a PC to the same network to which the EVM board is connected. Enter a URL of the form "http://ip-address-of-vm" in a web browser (for example, Internet Explorer, Firefox, or Opera). The IP address of the board is shown in the lower-right corner of the main menu of the A/V demos.

You should see a web page similar to the following with information about DaVinci technology and the DVEVM software.

Welcome!
DaVinci Technology from TI makes the next generation of digital video and audio end-equipment applications possible. Learn more at The DaVinci Effect website.

This web page is being served from an HTTP server running on the ARM core of the DaVinci SoC on the DaVinci EVM board. For the latest news and software updates on the DVEVM, see the DVEVM updates website.

Control the A/V Demo

The DVEVM comes with a demo application that shows the power of the DaVinci hardware and software that can be used to build incredible digital video and audio products. You can start the demo and query the state of the system by using the links below (which invoke simple CGI scripts on the DVEVM web server). Note that if the demo is already running, you will have to exit the demo using the IR remote before it can be (re)started using the web interface.

- Start
- Status

This is the same demo application that is automatically started whenever you turn on the EVM board.

Use this web page to interact with the board and run the A/V demos described in Section 3.3, Running the Standalone Demos. Two simple CGI scripts on the EVM enable you to start the demos (assuming they are not already running) and see what processes are running on the board. If you want to see the demo started from the web page, be sure to exit the demo first (use the Power button from the main menu).

The web server software is an open-source package called THTTPD (http://www.acme.com/software/thttpd/). It is designed to be small, fast, and portable. The source code is included with the DVEVM software. You can get the latest version directly from the web. The web server and CGI scripts are installed on the target in the /opt/dvsdk/dm6467/web directory.
Chapter 4

DVEVM Software Setup

This chapter explains how to use the software provided with the DVEVM kit.

4.1 Software Overview

To begin developing applications, you need to install the DVEVM development environment. This chapter outlines the steps required to load the DVEVM software onto the development host. You will need the distribution disks or the files they contain to get started.

The DaVinci software approach provides interoperable, optimized, production-ready video and audio codecs that leverage DSP and integrated accelerators. These codecs are built into configurable frameworks, and are presented via published APIs within popular operating systems (such as Linux) for rapid software implementation.

The following software is provided with the DVEVM.

- **Standalone demonstration software.** This is provided on the hard drive on the EVM. The hard-wired examples encode and decode audio, video, and speech. Another demo shows the board’s network capabilities. See Section 3.2 and Section 3.5.

- **MontaVista Linux Pro v5.0 System Tools and Target File System.** The version provided with the DVEVM kit is the demonstration version. It contains the following file:
  - mvl_5_0_.#_demo_sys_setuplinux.bin. This installation file contains the MontaVista Tool development tool chain and the target file system.

- **TI DVSDK Software.** This software package includes demo applications, Codec Engine software, and DVEVM documentation. This package can also be downloaded or upgraded from TI's myRegisteredSoftware after you have activated your ID. This package contains the following files:
  - this manual in PDF format
  - dvsdk_setuplinux_#_#_#_#.bin (DVSDK installer)
  - mvl_5_0_0_demo_lsp_setuplinux_#_#_#.bin
  - xdctools_setuplinux_#_#_#_#.bin (XDCtools installer)
  - bios_setuplinux_#_#_#.bin (DSP/BIOS installer)
  - TI-C6x-CGT-v##.##.##.bin (TI Code Generation Tools installer)
  - SoCAnalyzer_#.##.##.exe. SoC Analyzer installer.
  - data.tar.gz (Contains A/V data files for use by the demos)
  - restore/overlay.tar.gz (Contains demo files in case they are needed for recovery. You can generally ignore this file.)

- **SDI Board Support Software.** This disk contains ARM-based test code, CCStudio GEL files, and other EVM support software.
This release of the DVSDK does not install the codec servers when the DVSDK is installed. This is a change from previous releases. You can download the codec servers from TI’s myRegistered Software website as describe in Section 1.4. After installing the DVSDK software in Section 4.3.2, you will install the codec servers in Section 4.3.3.

Texas Instruments, in agreement with MontaVista Software Inc., is providing a demonstration version of the Linux Professional Edition v5.0 embedded operating system and development tools. The base DVEVM kit includes this demonstration version. The demo version is a subset of what MontaVista provides with the full Professional Edition. Tools such as DevRocket™ and the Professional Edition documentation are not included, but it is otherwise fully functional and useful for customers evaluating the DaVinci platform. Also, please note that this release does not include a MontaVista user license, and no direct customer support, warranty, or indemnification from MontaVista Software Inc. is provided.

You may choose to order the DaVinci Software Production Bundle (DVSPB), which includes the production release of this demonstration version of MontaVista Linux. This includes a full MontaVista license and the DevRocket IDE.

### 4.1.1 Command Prompts in This Guide

In this guide, commands are preceded by prompts that indicate the environment where the command is to be typed. For example:

- **host $**
  - Indicates command to be typed into the shell window of the host Linux workstation.

- **EVM #**
  - Indicates commands to be typed into the U-Boot shell in a console window connected to the EVM board’s serial port. (Section 2.2)

- **target $**
  - Indicates commands to be typed into the Linux shell in the terminal window connected to the EVM board’s serial port.
4.1.2 Software Components

The following figure shows the software components used for application development with the DVEVM kit:

In the previous figure, your application runs on the ARM subsystem. It handles I/O and application processing. To process video, image, speech, and audio signals it uses the VISA APIs provided by the Codec Engine. The Codec Engine, in turn, uses services such as DSP/BIOS Link and protocols such as xDAIS and xDM to communicate with a pre-configured Codec Engine Remote Server on the DSP subsystem. The DSP handles signal processing and the results are available to the ARM subsystem in shared memory. For more information, see the Codec Engine Application Developer's Guide (SPRUE67).

In addition, Linux running on the ARM makes a large number of APIs available to your application, including drivers and timers.
4.2 Preparing to Install

On a host system, mount the DVEVM demonstration DVD and copy the following files to a temporary location with at least 2.3 GB available space. Since you can delete the installation files after installing the software, a directory like /tmp is recommended.

- mvl_5_0_0_demo_sys_setuplinux.bin (disk 1)
- mvl_5_0_0_demo_lsp_setuplinux_##_###.bin (disk 2)
- dvsdk_setuplinux_##_###.bin (disk 2)
- xdc tools_setuplinux_##_###.bin (disk 2)
- bios_setuplinux_##_###.bin (disk 2)
- TI-C6x-CGT-v##.##.##.bin (disk 2)
- linux_performance_testbench_setup_##_##.bin (disk 2)

Updates to these installers may be available on the TI DaVinci Software Updates website listed in Section 1.5.

Ensure that an X graphical display is available.

4.3 Installing the Software

Installing the software used by the DVEVM involves performing the following steps:

- Section 4.3.1, Installing the Target Linux Software
- Section 4.3.2, Installing the DVSDK Software
- Section 4.3.3, Installing the Codec Servers
- Section 4.3.4, Installing the A/V Demo Files
- Section 4.3.5, Installing the SoC Analyzer
- Section 4.3.6, Installing the Linux Performance Test Bench
- Section 4.3.7, Exporting a Shared File System for Target Access
- Section 4.3.8, Testing the Shared File System
4.3.1 Installing the Target Linux Software

This section explains how to install Linux for use on the target board. This is a demonstration version of MontaVista Linux Pro v5.0.

Note that separate versions of Linux are used by the target and your host Linux workstation. The following Linux host operating system is tested with the DVEVM: Red Hat Enterprise Linux v4 (Server Edition).

To install the Linux software, follow these steps:

1) Log in as root on your host Linux workstation. This will allow you to successfully run the graphical installer to install MontaVista Linux.

    **Note:** If you are logged in with any account other than root, log out from your workstation (by issuing the `exit`, `logout` or `logoff` command (depending on your Linux distribution). Then login again as root.

2) We suggest that you create a directory called `/opt/mv_pro_5.0` using the following command. This will be the directory into which you install the software.

    ```bash
    host $ mkdir /opt/mv_pro_5.0
    ```

3) Execute each of the following bin files (where `#_#_#_#` is the current version number) from the temporary location that they were copied in order to extract the installers for the Linux tools, Linux kernel, and the file system. If a bin file does not run, make sure these files are executable (use `chmod +x *.bin`).

    Instead of the default installation directory, change the installation directory to the new directory you created in the previous step.

    ```bash
    host $ ./mv1_5_0_#_demo_sys_setuplinux.bin
    host $ ./mv1_5_0_0_demo_lsp_setuplinux_#_#_#.bin
    ```

4) After you execute these .bin files, make sure the following files are located in `/opt/mv_pro_5.0` (or in the `/mv_pro_5.0` subdirectory of the directory you chose in place of the default):

   - `mvltools5_0_#_#_#_#_#.tar.gz`
   - `DaVinciLSP_#_#_#_#.tar.gz`

5) Go to the location where you will unpack the tar files. For example:

    ```bash
    host $ cd /opt/mv_pro_5.0
    ```

6) Unpack the tar files (as root) by using the following commands:

    ```bash
    host $ tar zxf mvltools5_0_#_#_#_#_#.tar.gz
    host $ tar zxf DaVinciLSP_#_#_#_#.tar.gz
    ```
4.3.2 Installing the DVSDK Software

The DVSDK software includes Codec Engine components, DSP/BIOS Link, sample data files, xDAIS and xDM header files, and a contiguous memory allocator for Linux (CMEM).

Note: The installers for DSP/BIOS and Code Generation Tools (codegen) have a different default installation location. However, we strongly recommend that you change the default installation locations to place the components together (if you have not already installed the Linux versions of these components elsewhere). This simplifies the build setup steps.

To install the DVSDK software using the Linux installer, follow these steps:

1) Log in using a user account. The user account must have execute permission for the dvsdk_setuplinux_#_#_#.bin and xdctools_setuplinux_#_#.bin files. In order to do this, you must switch to "root" on the host Linux workstation, change the permissions of the files, and switch back to your user account. For example:

   host $ su root
   host $ chmod 777 dvsdk_setuplinux_#_#_#.bin
   host $ chmod 777 xdctools_setuplinux_#_#.bin
   host $ su <user>

2) Execute the DVSDK installer that you previously copied from the DVSDK DVD. For example:

   host $ cd /tmp
   host $ ./dvsdk_setuplinux_#_#_#.bin
This installs the DVSDK in /home/<useracct>/dvsdk_##_

3) Execute the XDC installer that you previously copied from the DVSDK DVD. For example:

    host $ ./xdctools_setuplinux_##_#.bin

When you are prompted, do not use the default installation location. Instead, install the software in the directory created in Step 2. For example, /home/<useracct>/dvsdk_##_#

4) Execute the DSP/BIOS installer that you previously copied from the DVSDK DVD. For example:

    host $ ./bios_setuplinux_5##_#.bin

When you are prompted, do not use the default installation location. Instead, install the software in the directory created in Step 2. For example, /home/<useracct>/dvsdk_##_#

5) Manually create the folder cg6x_6_##_, where # represents part of the version number. For example, you might create the following folder:

   /home/<useracct>/dvsdk_##_/cg6x_6_0_16

6) Execute the Code Generation Tools installer that you previously copied from the DVSDK DVD. For example:

    host $ ./TI-C6x-CGT-v##.##.##.bin

When the installer prompts for an installation location, do not use the default location. Instead, use the entire path to the dvsdk_##_# codegen directory you just created.

7) Remember to set the environment variable as directed by the installer. For example:

csh:

    host $ setenv C6X_C_DIR /home/<useracct>/dvsdk_##_/cg6x_6_##_/include:
         /home/<useracct>/dvsdk_##_/cg6x_6_##_/lib

    ksh or bash:

    host $ export C6X_C_DIR=/home/<useracct>/dvsdk_##_/cg6x_6_##_/include:
         /home/<useracct>/dvsdk_##_/cg6x_6_##_/lib

8) You can now delete the .bin files that you loaded into the temporary directory.
4.3.3 Installing the Codec Servers

This release of the DVSDK does not install the codec servers when the DVSDK is installed. This is a change from previous releases. To install the codec servers, follow these steps:

1) Download the codec servers from TI’s myRegistered Software website as described in Section 1.4. The file you download is dm6467_codecs_setuplinux_2_##_#.bin.

2) Install the codec servers in the same directory as the DVSDK, which is usually /home/<useracct>/dvsdk_#_. For example:

   host $ ./dm6467_codecs_setuplinux_##_##.bin

   (If you decide to install the codec servers elsewhere, remember to update the CODEC_INSTALL_DIR location in Rules.make.)

4.3.4 Installing the A/V Demo Files

Disk 2 contains the A/V files used by the demos. After following the instructions in the previous section, follow these instructions to install the A/V files:

1) Go to the "clips" subdirectory of the DVSDK directory that you set up previously. For example:

   host $ cd /home/<useracct>/dvsdk_##_/clips

2) Mount disk 2 (by either using the mount command or automatically, depending on your Linux distribution), and copy the data.tar.gz file from the mount directory to the clips directory. For example:

   host $ mount /dev/cdrom /media/cdrom0
   host $ cp /media/cdrom0/data.tar.gz ./

3) Extract the A/V data files. For example:

   host $ tar xzf data.tar.gz
4.3.5 Installing the SoC Analyzer

SoC Analyzer is a graphical tool that runs on a Windows development host and uses data collected from Linux, DSP/BIOS, and Codec Engine to provide system-level execution and performance analysis for debugging and profiling DVEVM software execution. Follow these instructions to install SoC Analyzer:

1) Insert the TI DVSDK software disk into the Windows development host PC.
2) Browse to the SoCAnalyzer/WinXP folder.
3) Double-click on the SoCAnalyzer_#.#.#.#.exe file to start the installer.
4) Follow the installer’s prompts to install the software.

4.3.6 Installing the Linux Performance Test Bench

This section explains how to install the Linux Performance Test Bench (LPTB) for use on the target board. Follow these steps to install:

1) Log in to your host Linux workstation.
2) Execute the following bin file (where #_#_#_# is the current version number) from the temporary location to which you copied it. This extracts the installer for the Linux Performance Test Bench. If the bin file does not run, make sure the file is executable (use chmod +x *.bin). Instead of the default installation directory (/opt), you may use a different installation directory if you like.

   host $ ./linux_performance_testbench_setup_#.#.#.#.bin

3) After you execute this .bin file, make sure the following file is located in the installation directory:

   linux_performance_test_bench_#_#_#_#.tar.gz

4) Go to the location where you will unpack the tar file. For example:

   host $ cd /opt/

5) Unpack the tar file (as root) by using the following command. Note that unpacking this tar file will overwrite any existing LPTB files that were previously installed.

   host $ tar zxisf linux_performance_test_bench_#_#_#_#.tar.gz

This creates the psp_test_bench directory structure under the /opt/linux_performance_test_bench_#.#.#. directory.
4.3.7 Exporting a Shared File System for Target Access

Although the board’s hard drive contains a file system, during development it is more convenient to have the target board NFS mount a file system on a host Linux workstation. Once you have tested the application, you can store it on the board’s hard drive for a standalone demonstration.

**Note:** Using video files from an NFS file system may result in a low frame rate when encoding/decoding videos.

Before the board can mount a target file system, you must export that target file system on the host Linux workstation. The file system uses an NFS (Network File System) server. The exported file system will contain the target file system and your executables.

To export the file system from your NFS server, perform the following steps. You only need to perform these steps once.

1) Log in with a user account on the host Linux workstation.
2) Perform the following commands to prepare a location for the MontaVista file system. For example:
   ```
   host $ cd /home/<useracct>
   host $ mkdir -p workdir/filesys
   host $ cd workdir/filesys
   ```
3) Switch user to "root" on the host Linux workstation.
   ```
   host $ su root
   ```
4) Perform the following commands to create a copy of the target file system with permissions set for writing to the shared area as <useracct>. Substitute your user name for <useracct>. If you installed in a location other than /opt/mv_pro_5.0, use your location in the cp command.
   ```
   host $ cp -a /opt/mv_pro_5.0/montavista/pro/devkit/arm/v5t_le/target/* .
   host $ chown -R <useracct> opt
   ```
5) Edit the /etc/exports file on the host Linux workstation (not the exports file on the target filesystem). Add the following line for exporting the filesys area, substituting your user name for <useracct>. Use the full path from root; ~ may not work for exports on all file systems.
   ```
   /home/<useracct>/workdir/filesys *(rw,no_root_squash,no_all_squash,sync)
   ```
   **Note:** Make sure you do not add a space between the * and the ( in the above command.
6) Still as root, use the following commands to make the NFS server aware of the change to its configuration and to invoke an NFS restart.

```
host $ /usr/sbin/exportfs -av
host $ /sbin/service nfs restart
```

**Note:** Use `exportfs -rav` to re-export all directories. Use `/etc/init.d/nfs status` to verify that the NFS status is running.

7) Verify that the server firewall is turned off:

```
host $ /etc/init.d/iptables status
```

If the firewall is running, disable it:

```
host $ /etc/init.d/iptables stop
```

### 4.3.8 Testing the Shared File System

To test your NFS setup, follow these steps:

1) Get the IP address of your host Linux workstations as follows. Look for the IP address associated with the eth0 Ethernet port.

```
host $ /sbin/ifconfig
```

2) Open a terminal emulation window to connect to the EVM board via RS-232 using the instructions in Section 2.2. If you have a Windows workstation, you can use HyperTerminal. If you have a Linux workstation, you might use Minicom. (You may need to turn on line wrap.)

3) Power on the EVM board, and abort the automatic boot sequence by pressing a key in the console window (Section 2.2).

4) Set the following environment variables in the console window:

```
EVM # setenv nfshost <ip address of nfs host>
EVM # setenv rootpath <directory to mount>
EVM # setenv bootargs console=ttyS0,115200n8 noinitrd rw
     ip= dhcp root=/dev/nfs
     nfsroot=$(nfshost):$(rootpath),nolock mem=120M
     davincihd_capture.channel0_numbuffers=4
```

Note that the `setenv bootargs` command should be typed on a single line. Also note that you should avoid using the numeric keypad to enter numbers, as it can sometimes insert extra invisible characters.

The `<directory to mount>` must match what you specified in Step 5 of Section 4.3.7. For example, `/home/<useracct>/workdir/filesys`.
Hints: You may want to use the printenv command to print a list of your environment variables. You can also save these setenv commands in a .txt file from which you can paste them in the future.

5) Save the environment so that you don’t have to retype these commands every time you cycle power on the EVM board:

   EVM # saveenv

6) Boot the board using NFS:

   EVM # boot

7) You can now log in as “root” with no password required.

See Section A.3, Alternate Boot Methods for information about booting with TFTP or NFS and using flash or the EVM’s hard drive.

4.3.9 Notes on Using Evaluation/Production Codecs

As part of the DVSDK installation, you received a number of codecs:

- H.264 Base Profile Decoder
- H.264 HP Encoder
- MPEG2 Decoder
- MPEG4 AAC LC Decoder
- AAC Encoder
- G.711 Decoder (not a TI codec)
- G.711 Encoder (not a TI codec)

These codecs are provided under a “for demonstration-only” license agreement. If you wish to use these codecs in a production development environment, you can go to the http://www.ti.com/digitalmediasoftware web site and click on “Software Inventory” to download the latest production versions and the appropriate license agreement.
Setting Up the Build/Development Environment

4.4 Setting Up the Build/Development Environment

To set up the GPP-side development and build environment, follow these steps:

1) Log in to your user account (and not as root) on the NFS host system.

2) Set your PATH so that the MontaVista tool chain host tools and cross compiler (arm_v5t_le-gcc) can be found. For example, in a default installation of the MontaVista LSP, you should add a definition like the following to your shell resource file (for example, ~/.bashrc):

   ```
   PATH="/opt/mv_pro_5.0/montavista/pro/devkit/arm/v5t_le/bin:
   /opt/mv_pro_5.0/montavista/pro/bin:
   /opt/mv_pro_5.0/montavista/common/bin:$PATH"
   ```

   If you installed in a location other than /opt/mv_pro_5.0, use your own location in the PATH.

3) Remember to use the following command after modifying your .bashrc file:

   ```
   host $ source ~/.bashrc
   ```

4.4.1 Writing a Simple Program and Running it on the EVM

Make sure you have performed the steps in Section 4.3.7, Exporting a Shared File System for Target Access and Section 4.4, Setting Up the Build/Development Environment.

Perform the following steps on the NFS host system as user (not as root):

1) host $ mkdir /home/<useracct>/workdir/filesys/opt/hello

2) host $ cd /home/<useracct>/workdir/filesys/opt/hello

3) Create a file named hello.c using a text editor (for example, gedit, kedit, xemacs, or vi), and add the following contents to it:

   ```
   #include <stdio.h>

   int main() {
       printf("Buongiorno DaVinci!\n");
       return 0;
   }
   ```

4) host $ arm_v5t_le-gcc hello.c -o hello
Perform the following steps on the target board. You may use either the target’s console window (Section 2.2) or a telnet session.

1) target $ cd /opt/hello

2) Run ./hello. The output should be:

Buongiorno DaVinci!

### 4.5 Building a New Linux Kernel

If you modify the target’s Linux kernel sources, you will need to rebuild it and then boot it up by either replacing the kernel that comes installed on the EVM board’s flash or by having the U-Boot utility use TFTP to boot the kernel over a network connection.

Make sure you have completed Section 4.4, Setting Up the Build/Development Environment and Section 4.4.1, Writing a Simple Program and Running it on the EVM before attempting to build a new kernel.

To rebuild the Linux Kernel, follow these steps:

1) Log in to your user account (not as root).

2) Set the PLATFORM variable in the Rules.make file as described in Section 4.6.

3) Use commands like the following to make a local working copy of the MontaVista Linux Support Package (LSP) in your home directory. This copy contains the embedded Linux 2.6.18 kernel plus the DaVinci drivers. If you installed in a location other than /opt/mv_pro_5.0, use your location in the cp command.

```
host $ cd /home/<useracct>
host $ mkdir -p workdir/lsp
host $ cd workdir/lsp
host $ cp -R /opt/mv_pro_5.0/montavista/pro/devkit/lsp/ti-davinci .
```

4) Use the following commands to configure the kernel using the DaVinci defaults. Note that CROSS_COMPILE specifies a prefix for the executables that is used during compilation:

```
host $ cd ti-davinci/linux-2.6.18_pro500
host $ make ARCH=arm CROSS_COMPILE=arm_v5t_le- davinci_dm6467_defconfig
```

5) To modify the kernel options, you will need to use a configuration command such as “make menuconfig” or “make xconfig”. To verify the MontaVista default kernel options, use the following command:

```
host $ make ARCH=arm CROSS_COMPILE=arm_v5t_le- checksetconfig
```
6) If you want to enable Linux Trace for the SoC Analyzer, follow these substeps. Otherwise, skip to Step 7.
   a) Use this command to go to the configuration menu for the ARM:
      
      host $ make ARCH=arm CROSS_COMPILE=arm_v5t_le- menuconfig

      b) Navigate to Device Drivers->Filesystems->Pseudo Filesystems.
      
      c) Set Relayfs file system support to "built-in".
      
      d) Return to the main menu and navigate to General Setup.
      
      e) Enable Linux Trace Toolkit Support as "built-in".
      
      f) Select Exit to save your changes and exit the configuration screen.

7) Compile the kernel using the following command:

      host $ make ARCH=arm CROSS_COMPILE=arm_v5t_le- uImage

8) If the kernel is configured with any loadable modules (that is, selecting <M> for a module in menuconfig), use the following commands to rebuild and install these modules:

      host $ make ARCH=arm CROSS_COMPILE=arm_v5t_le- modules

      host $ make ARCH=arm CROSS_COMPILE=arm_v5t_le-
      INSTALL_MOD_PATH=/home/<useracct>/workdir/filesys
      modules_install

9) Use the following command to copy the ulimage to a place where U-Boot can use TFTP to download it to the EVM. These commands assume you are using the default TFTP boot area, which is /tftpboot. If you use another TFTP root location, please change /tftpboot to your own TFTP root location. (Perform these commands as root or use a chown ulimage command to get ownership of the file.)

      host $ cp /home/<useracct>/workdir/lsp/ti-davinci/linux-2.6.18_pro500/arch/arm/boot/uImage
      /tftpboot

      host $ chmod a+r /tftpboot/uImage

For more information on setting up a TFTP server, see Section A.2.

See a standard Linux kernel reference book or online source for more about Linux build configuration options.
4.6 Rebuilding the DVSDK Software for the Target

To place demo files in the /opt/dvsdk/dm6467 directory, you need to rebuild the DVSDK software. To do this, follow these steps:

1) If you have not already done so, rebuild the Linux kernel as described in Section 4.5.

2) Change directory to dvsdk_##.

3) Edit the Rules.make file in the dvsdk_## directory as needed. If you installed components in the default locations, the directory definitions may already be correct, but you should verify them in any case.

   ■ Set PLATFORM to match your EVM board as follows:

   PLATFORM=dm6467

   ■ Set DVSDK_INSTALL_DIR to the top-level DVSDK installation directory as follows:

   DVSDK_INSTALL_DIR=/home/<useracct>/dvsdk_##

   ■ Modify the following variables as needed to match the locations of these components on your Linux host. We recommend that these components be installed in the /home/<useracct>/dvsdk_## directory, but you may have installed them elsewhere.

   XDC_INSTALL_DIR=/home/<useracct>/dvsdk_##/xdctools_##
   FC_INSTALL_DIR=/home/<useracct>/dvsdk_##/fc_##
   BIOS_INSTALL_DIR=/home/<useracct>/dvsdk_##/bios_##

   ■ Make sure LINUXKERNEL_INSTALL_DIR is defined as follows:

   LINUXKERNEL_INSTALL_DIR=/home/<useracct>/workdir/lsp/ti-davinci/linux-2.6.18_pro500

   ■ Make sure MVTOOL_DIR points to the MontaVista Linux tools directory as follows:

   MVTOOL_DIR=/opt/mv_pro_5.0/montavista/pro/devkit/arm/v5t_le

   ■ Make sure EXEC_DIR points to the opt directory on the NFS exported file system as follows:

   EXEC_DIR=/home/<useracct>/workdir/filesys/opt/dvsdk/$(PLATFORM)

4) While in the same directory that contains Rules.make, use the following commands to build the DVSDK demo applications and put

DVEVM Software Setup 4-17
the resulting binaries on the target file system specified by EXEC_DIR.

    host $ make clean
    host $ make
    host $ make install

5) You can test the rebuilt DVEVM software by booting your NFS file system and running the demos from the command line as described in Section 3.4.

4.7 Booting the New Linux Kernel

After building the new kernel, in order to use it to boot the DaVinci board, you must transfer it to the board via TFTP. It is assumed you have completed the steps in Section 4.5, Building a New Linux Kernel and the boot file, uImage has been copied to /tftpboot (or some other site-specific TFTP accessible location).

1) Power on the EVM board, and abort the automatic boot sequence by pressing a key in the console window (Section 2.2).

2) Set the following environment variables. (This assumes you are starting from a default, clean U-Boot environment. See Section 3.1, Default Boot Configuration for information on the U-Boot default environment.)

    EVM # setenv bootcmd 'dhcp;bootm'
    EVM # setenv serverip <tftp server ip address>
    EVM # setenv bootfile uImage
    EVM # setenv bootargs mem=120M console=ttyS0,115200n8
           root=/dev/hda1 rw noinitrd ip=dhcp
davincihd_capture.channel0_numbuffers=4

    Note that the setenv bootargs command should be typed on a single line.

3) Boot the board:

    EVM # boot

This configuration boots a new Linux kernel via TFTP with a hard drive based file system. To boot via TFTP using an NFS file system, see Section A.3.4.

For instructions on how to verify that your host workstation is running a TFTP server, and for instructions on what to do if it isn’t, see Section A.2.

For more details on booting, see Section A.3. For information about installing uImage in NAND flash memory, see the LSP 2.0 DaVinci Linux EVM Installation User’s Guide (SPRUG94).
4.8 Testing the Build Environment

To test your DVSDK software installation, you can build one of the Codec Engine servers. This server is a DSP-side application. Building it tests the installation of DSP-side development components. You must have also installed the codec servers as described in Section 4.3.3.

To build the video_copy server, follow these steps:

1) Go to /home/<useracct>/dvsdk_/###/codec_engine_/###/examples and open the build_instructions.html file.

2) Follow the step-by-step instructions for building examples. When you are editing the xdcpaths.mak file, note that the DVSDK installation does not include the cetools directory, so you will need to set the USE_CETOOLS_IF_EXISTS variable to 0, and modify additional variables to point to the locations of xDAIS, DSP/BIOS Link, CMEM, and Framework Components.

3) Go to the video_copy server directory. (/home/<useracct>/dvsdk_/###/codec_engine_/###/examples/servers/video_copy) to inspect the built server.

4.9 Using the Digital Video Test Bench (DVTB)

The Digital Video Test Bench (DVTB) is a Linux utility that was developed to execute end-to-end data flows using the DVSDK for any platform. DVTB uses the Codec Engine VISA APIs and Linux driver peripheral APIs to encode and decode video, image, audio and speech streams.

Using DVTB, you can configure codecs and/or peripherals before starting a data flow. This enables you to try different use case scenarios and evaluate the system.

The DVSDK installation places DVTB in the /home/<useracct>/dvsdk_/###/dvtb_/### directory, where ### is the DVTB version number).

To install DVTB to the target file system, perform the following steps on the host machine where the DVSDK has been installed:

1) Make sure the Rules.make file defines PLATFORM correctly as described in Section 4.6.

2) Perform the following commands:

```bash
host $ cd /home/<useracct>/dvsdk_/###/dvtb_/###
host $ make clean CONFIGPKG=dm6467
host $ make CONFIGPKG=dm6467
```
3) Copy the binaries "dvtb-d" and "dvtb-r" to /opt/dvsdk/dm6467 on the device's target filesystem and run it there. It must be in the same directory as the DSP executables.

For further details on the DVTB, see the following documents:

- **Release Notes.**
  
  `/home/<useracct>/dvsdk_#_#/dvtb_#_#_/docs/dvtb_release_notes.pdf`

- **User Guide.**
  
  `/home/<useracct>/dvsdk_#_#/dvtb_#_#_/docs/dvtb_user_guide.pdf`

### 4.10 Configuring and Compiling the Linux Performance Test Bench

See Sections 3.3 and 3.4 of the Linux Performance Test Bench user guide for your platform. These sections contain configuration and compilation information. You can find these documents in the `linux_performance_test_bench_#.#.#.#/psp_test_bench/docs` folder.
4.11 Running The SoC Analyzer

Built upon Texas Instruments’ eXpressDSP data visualization technology (DVT), the SoC Analyzer simplifies debugging, analysis, and optimization of DVEVM applications. It collects execution, interaction, and resource utilization logs from Linux, DSP/BIOS, Codec Engine, and drivers and presents system-level analysis and graphical visualization such as:

- System execution flow
- System performance
- Resource utilization
- Processor interaction

Install the SoC Analyzer as described in Section 4.3.5.
To run the SoC Analyzer, double-click the SoC Analyzer icon on the Windows Desktop or select it from the Windows Start menu under Texas Instruments.

The SoC Analyzer comes with online help, which can be accessed from the SoC Analyzer Help menu (choose Help->Help Contents). Select the DM646x SoC Analyzer User Guide.

Follow the "Getting Started" chapter of the DM646x SoC Analyzer User Guide, which includes steps on how to run the tool with demonstration logs shipped with the product. This "Getting Started" chapter also contains the steps you should perform to enable your applications to collect logs for the SoC Analyzer. The DVEVM Demo Application has such logging enabled by default. The uImage must be rebuilt to enable logging.

4.12 Documentation for DSP-Side Development

After you have installed the DVSDK software, you can begin to create and modify DSP-side applications for your DM646x.

The following table lists places to look for documentation on using each component of the DVSDK. Documents in PDF, HTML, and text format are included in the installations with each product.

<table>
<thead>
<tr>

A.1 Putting Demo Applications in the Third-Party Menu

You can add your own demos to the Third-Party Menu by following the steps in this section. Only four demos can be shown at once in the user-interface. If you add more than four demos, the first four in alphabetical order are shown.

1) Create the following files for your demo:
   - logo.jpg. This is the logo of the third party company which will be showed next to the demo description. The picture needs to be in JPEG format and of size 50x50.
   - readme.txt. This is a text file. The first 40 characters of the file should briefly describe the demo. The demo interface displays up to 40 characters, but stops if it encounters a new line character. For example, the file might contain "Video Phone demo" or "Network Audio demo".
   - app.sh. This is an executable that launches your demo. It can either be the demo executable itself or a shell script that executes the executable. (If this is a shell script, make sure its executable bit is set for all). A script could look something like:

     #!/bin/sh
     exec ./mydemoname

   - other files. If app.sh is a shell script, your demo executable will have some other name. You may also need to include data files or other files used by the executable.

   **Note:** The demo application must use relative paths to access any files it needs at runtime. This because the archive is extracted to another location from which the demo is executed.

2) Create a gzipped tar file (ends with .tar.gz) that archives all the files in the previous list. For example, if your files are logo.jpg, readme.txt, and app.sh, you could use the following command:

   tar cvzf ti_videophone.tar.gz logo.jpg readme.txt app.sh

   Name the tar file using `<company>_<demoname>.tar.gz` (with no spaces in the file name) as the convention. For example, a video phone demo created by Texas Instruments would be named ti_videophone.tar.gz. The name must be unique since all demos are installed in the same directory.

   The three required files must be in the top-level directory of the archive. Other files may be in subdirectories, so long as the demo
uses relative references to access them. For example, the following directory structure might be used in the archive:

|-- app.sh
|-- data
| |-- datafile1
| `-- datafile2
`-- logo.jpg
`-- readme.txt

To check the format of the file you create, execute the following command in Linux. The result should say "gzip compressed data".

    file <filename>.tar.gz

3) Put your archive in the "thirdpartydemos" subdirectory of the target installation directory. This is where the DVSDK software was installed on the target file system. The default target installation directory is /opt/dvsdk/dm6467, so the default location for demo archives is /opt/dvsdk/dm6467/thirdpartydemos. Do not extract the contents of the archive in this location. Extraction is performed behind-the-scenes each time the demo is run.
A.2 Setting Up a TFTP Server

You can check to see if a TFTP server is set up with the following command:

host $ rpm -q tftp-server

If it is not set up, you can follow these steps:

1) If you have not yet installed MontaVista Linux Demo Edition (see Section 4.3.1), you can download a TFTP server for your Linux host from many locations on the Internet. Search for "tftp-server".

2) To install TFTP, use this command, where -#.##.# is the version number portion of the filename:

host $ rpm -ivh tftp-server-#.##.#.rpm

You should see the following output:

warning: tftp-server-#.##.#.rpm:
V3 DSA signature: NOKEY, key ID 4f2a6fd2
Preparing... #################################### [100%]
1:tftp-server ################################### [100%]

3) Confirm that TFTP is installed with this command:

host $ /sbin/chkconfig --list | grep tftp

If you want to turn on the TFTP server, use this command:

/sbin/chkconfig tftp on

The default root location for servicing TFTP files is /tftpboot.
A.3 Alternate Boot Methods

The default configuration for the EVM is to boot from flash with the file system on the EVM’s hard drive. The following are alternate ways you may want to boot the board:

- TFTP boot with hard drive file system (Section A.3.2)
- Flash boot with NFS file system (Section A.3.3)
- TFTP boot with NFS file system (Section A.3.4)

The subsections that follow show the environment variable settings used to enable each boot method.

**Note:** Using video files from an NFS file system may result in a low frame rate when encoding/decoding videos.

To boot in one of these modes, follow these steps:

1) Power on the EVM board, and abort the automatic boot sequence by pressing a key in the console window (Section 2.2).

2) Set the environment variables indicated in the following subsections for the boot mode you want to use. (Note that the `setenv bootargs` command should be typed on a single line.)

3) If you want to use these settings as the default in the future, save the environment:

   ```
   EVM # saveenv
   ```

4) Boot the board using the settings you have made:

   ```
   EVM # boot
   ```

A.3.1 Booting from Flash Using the EVM’s Hard Drive File System

This is the default, out-of-the-box boot configuration.

To boot in this mode, set the following parameters after you abort the automatic boot sequence:

```bash
EVM # setenv bootcmd 'nboot 80700000 0 a0000;bootm'
EVM # setenv bootargs mem=120M console=ttyS0,115200n8
     root=/dev/hda1 rw noinitrd ip=dhcp
davincihd_capture.channel0_numbuffers=4
```
A.3.2 Booting via TFTP Using the EVM’s Hard Drive File System

To boot in this mode, set the following parameters after you abort the automatic boot sequence:

```sh
EVM # setenv bootcmd 'dhcp;bootm'
EVM # setenv bootargs mem=120M console=ttys0,115200n8
    root=/dev/hdal rw noinitrd ip=dhcp
    davincihd_capture.channel10_numbuffers=4
EVM # setenv serverip <tftp server ip address>
EVM # setenv bootfile <path on tftpserver>/uImage
```

A.3.3 Booting from Flash Using NFS File System

To boot in this mode, set the following parameters after you abort the automatic boot sequence:

```sh
EVM # setenv bootcmd 'nboot 80700000 0 a0000;bootm'
EVM # setenv nfshost <ip address of nfs host>
EVM # setenv rootpath <directory to mount>
EVM # setenv bootargs console=ttys0,115200n8 noinitrd rw
    ip=dhcp root=/dev/nfs
    nfsroot=$(nfshost):$(rootpath),nolock mem=120M
    davincihd_capture.channel10_numbuffers=4

*For example, <directory to mount> might be
/home/<useracct>/workdir/filesys.
```

A.3.4 Booting via TFTP Using NFS File System

To boot in this mode, set the following parameters after you abort the automatic boot sequence:

```sh
EVM # setenv bootcmd 'dhcp;bootm'
EVM # setenv serverip <tftp server ip address>
EVM # setenv bootfile <name of kernel image>
EVM # setenv rootpath <root directory to mount>
EVM # setenv nfshost <ip address of nfs host>
EVM # setenv bootargs console=ttys0,115200n8 noinitrd rw
    ip=dhcp root=/dev/nfs
    nfsroot=$(nfshost):$(rootpath),nolock mem=120M
    davincihd_capture.channel10_numbuffers=4

The <root directory to mount> must match the file system that you set up on your workstation. For example, /home/<useracct>/workdir/filesys.
```
A.4 Rebuilding DSP/BIOS Link

If you want to rebuild the DSP/BIOS Link package, follow these steps (assuming you are using the bash shell):

1) Edit the davinci_mvlpro5.0.mk file, which is in the
/home/<useracct>/dvsdk_/#/dsplink_/#/packages/dsplink/make/Linux/
directory, to make sure the BASE_BUILDOS and BASE_CGTOOLS
variables correctly point to the correct locations. For example:

```
BASE_BUILDOS := /home/<useracct>/workdir/lsp/ti-davinci/linux-2.6.18_pro500
BASE_CGTOOLS := /opt/mv_pro_5.0/montavista/pro/devkit/arm/v5t_le/bin
```

2) Define the DSPLINK environment variable to be the absolute path to
the "dsplink" directory. (Use export for bash shell, and setenv for tcsh
shell.) For example:

```
host $ export DSPLINK=/home/<useracct>/dvsdk_/#/dsplink_/#/packages/dsplink
```

3) Move to the Linux build script directory:

```
host $ cd $DSPLINK/etc/host/scripts/Linux
```

4) Build DSP/BIOS Link as follows:

```
host $ sh -f buildmodule.sh
```

5) The rebuilt kernel module is called dsplink_ko. It is located in the
$DSPLINK/gpp/export/BIN/Linux/Davinci/DM6467/RELEASE/
directory.
A.5 Restoring and Updating the EVM Hard Disk Drive

This section describes how to restore and update all the files on the EVM hard disk drive (HDD), including the Linux file system and the demos. Using these restore procedures, you can return your board to a known state if anything happens to the data on the EVM board's HDD.

This section assumes that you have configured a host Linux workstation with the software necessary to perform an NFS root mount with the EVM as described in Section 4.3.7 and Section 4.3.8.

For further information about upgrading and flashing, see the TI DaVinci Technology Developers Wiki at http://wiki.davincidsp.com.

For information about restoring the kernel and bootloaders, see the LSP 2.0 DaVinci Linux EVM Installation User’s Guide (SPRUG94).

For instructions on how to have the EVM boot Linux from flash using an NFS file system, see Section A.3.3.

The EVM hard disk drive (HDD) can be restored from a target EVM HDD partition or from the host Linux workstation file system. Either method will achieve the same result.

Restoring the EVM HDD takes 10 to 15 minutes. The restore script must uncompress 600 MB of compressed data and load it to the /dev/hda1 partition.

After the hard drive restore process has completed, make sure to restart the EVM and configure U-Boot to root mount via the local HDD. The steps for this type of boot are provided in Section A.3.1, Booting from Flash Using the EVM’s Hard Drive File System.

A.5.1 Restoring From Target EVM HDD Partition

Follow these steps to restore the HDD from the restore partition on the HDD itself:

1) Make a directory for mounting the HDD restore partition:

   EVM # mkdir /mnt/restore

2) Mount the HDD restore partition:

   EVM # mount -t ext3 /dev/hda2 /mnt/restore

3) Set the Linux date variable to today's date. If the date is too far off, the target file system installation generates a bunch of warnings.

   EVM # date MMDDHHMMCCYY

   For example, for 9:00 am on April 18th, 2006, enter 041809002006.
4) Change directory to /mnt/restore:

   EVM # cd /mnt/restore

5) Add execute permissions for the script:

   EVM # chmod +x restore-hdd

6) Run the restore script:

   EVM # ./restore-hdd

7) The script will ask for confirmation: “This will destroy all data on /dev/hda1 - are you sure?” Type yes.

8) After the HDD restore is complete, shutdown the EVM:

   EVM # halt

9) When the "Power down" message is printed in the terminal window, it is safe to power down the EVM.

10) Restart the EVM and configure U-Boot to root mount via the local HDD. Follow the steps in Section A.3.1, *Booting from Flash Using the EVM’s Hard Drive File System*. 
A.5.2 Restoring From Host Linux Workstation File System

Follow these steps to restore the HDD from the host Linux workstation restore directory:

1) On your host workstation, copy the restore directory from the TI DVSDK disk to /home/<useracct>/workdir/filesys/restore. After NFS mounting this file system, this will appear as the /restore directory on the EVM.

2) Login to the EVM as root.

3) Go to the /restore directory.

   EVM # cd /restore

4) Set the Linux date variable to today's date. If the date is too far off, the target file system installation generates warnings for each file it installs.

   EVM # date MMDDHHMMCCYY
   
   For example, for 9:00 am on April 18th, 2006, enter 041809002006.

5) Add execute permissions on the prep-hdd script.

   EVM # chmod +x prep-hdd

6) Run the prep-hdd script in the /restore directory.

   EVM # ./prep-hdd /restore

7) The script will ask for confirmation: "Are you sure you want to partition and format /dev/hda?" Type yes.

8) After the HDD restore is complete, shutdown the EVM:

   EVM # halt

9) When the "Power down" message is printed in the terminal window, it is safe to power down the EVM.

10) Restart the EVM and configure U-Boot to root mount via the local HDD. Follow the steps in Section A.3.1, Booting from Flash Using the EVM's Hard Drive File System.
