

mmWave Radar Interface Control Document

Revision 2.7

February 06, 2020

Contents

	Page
Contents	xi
List of Figures	xi
List of Tables	xvii
Revision History	xix
1 Introduction	1
1.1 Scope	1
1.2 Intended Audience	2
2 TI mmWave Radar Sensor Communications Overview	3
2.1 Communication Link Description	3
2.2 Communication Link configuration	3
2.2.1 SPI	3
2.2.2 Mailbox	3
2.3 Radar Message Structure	5
2.3.1 SYNC	6
2.3.2 MSGHDR	6
2.3.3 MSGDATA	12
2.3.4 CRC	13
3 Message Processing	15
3.1 Communication protocol	15
3.2 Communication Sequence	16
3.2.1 Command/Response Sequence (Host)	16
3.2.2 Flow Diagram (Host) – Command/Response	17
3.2.3 Flow Diagram (Host) – Bootup/ Asynchronous Event	18
3.2.4 SPI Message Sequence – Command/Response	19
4 Radar Interface Messages Descriptions	20
4.1 Summary of all messages and their associated sub-blocks	20
4.2 AWR_ACK_MSG	26

4.3	AWR_NACK_MSG	26
4.4	AWR_ERROR_MSG	27
4.5	AWR_RF_STATIC_CONF_SET_MSG	27
4.6	AWR_RF_STATIC_CONF_GET_MSG	28
4.7	AWR_RF_INIT_MSG	29
4.8	AWR_RF_DYNAMIC_CONF_SET_MSG	29
4.9	AWR_RF_DYNAMIC_CONF_GET_MSG	31
4.10	AWR_RF_FRAME_TRIG_MSG	31
4.11	AWR_RF_ADVANCED_FEATURES_CONF_SET_MSG	32
4.12	AWR_RF_MONITORING_CONF_SET_MSG	32
4.13	AWR_RF_STATUS_GET_MSG	34
4.14	AWR_RF_MONITORING_REPORT_GET_MSG	35
4.15	AWR_RF_MISC_CONF_SET_MSG	35
4.16	AWR_RF_MISC_CONF_GET_MSG	36
4.17	AWR_RF_ASYNC_EVENT_MSG1	36
4.18	AWR_RF_ASYNC_EVENT_MSG2	38
4.19	AWR_DEV_RFPOWERUP_MSG	39
4.20	AWR_DEV_CONF_SET_MSG	40
4.21	AWR_DEV_CONF_GET_MSG	41
4.22	AWR_DEV_FILE_DOWNLOAD_MSG	42
4.23	AWR_DEV_FRAME_CONFIG_APPLY_MSG	42
4.24	AWR_DEV_STATUS_GET_MSG	43
4.25	AWR_DEV_ASYNC_EVENT_MSG	43
5	Radar Functional APIs	45
5.1	Sub block related to AWR_ERROR_MSG	45
5.1.1	Sub block 0x0000 – AWR_RESP_ERROR_SB	45
5.2	Sub blocks related to AWR_RF_STATIC_CONF_SET_MSG	46
5.2.1	Sub block 0x0080 – AWR_CHAN_CONF_SET_SB	46
5.2.2	Sub block 0x0082 – AWR_ADCOUT_CONF_SET_SB	49
5.2.3	Sub block 0x0083 – AWR_LOWPOWERMODE_CONF_SET_SB	50
5.2.4	Sub block 0x0084 – AWR_DYNAMICPOWERSAVE_CONF_SET_SB	50
5.2.5	Sub block 0x0085 – AWR_HIGHSPEEDINTFCLK_CONF_SET_SB	51
5.2.6	Sub block 0x0086 – AWR_RF_DEVICE_CFG_SB	52
5.2.7	Sub block 0x0087 – AWR_RF_RADAR_MISC_CTL_SB	55
5.2.8	Sub block 0x0088 – AWR_CAL_MON_FREQUENCY_LIMITS_SB	56
5.2.9	Sub block 0x0089 – AWR_RF_INIT_CALIBRATION_CONF_SB	57
5.2.10	Sub block 0x008A – AWR_CAL_MON_FREQUENCY_TX_POWER_LIMITS_SB	59
5.2.11	Sub block 0x008B – AWR_CAL_DATA_RESTORE_SB	61
5.2.12	Sub block 0x008C – AWR_PHASE_SHIFTER_CAL_DATA_RESTORE_SB	62
5.2.13	Sub block 0x008D – AWR_APLL_SYNTH_BW_CONTROL_SB	63
5.3	Sub blocks related to AWR_RF_STATIC_CONF_GET_MSG	64

5.3.1	Sub block 0x00A0 – 0x00AA – RESERVED	64
5.3.2	Sub block 0x00AB – AWR_CAL_DATA_SAVE_SB	64
5.3.3	Sub block 0x00AC – AWR_PHASE_SHIFTER_CAL_DATA_SAVE_SB	67
5.4	Sub blocks related to AWR_RF_INIT_MSG	69
5.4.1	Sub block 0x00C0 – AWR_RF_INIT_SB	69
5.5	Sub blocks related to AWR_RF_DYNAMIC_CONF_SET_MSG	69
5.5.1	Sub block 0x0100 – AWR_PROFILE_CONF_SET_SB	69
5.5.2	Sub block 0x0101 – AWR_CHIRP_CONF_SET_SB	78
5.5.3	Sub block 0x0102 – AWR_FRAME_CONF_SET_SB	79
5.5.4	Sub block 0x0103 – AWR_CONT_STREAMING_MODE_CONF_SET_SB	83
5.5.5	Sub block 0x0104 – AWR_CONT_STREAMING_MODE_EN_SB	86
5.5.6	Sub block 0x0105 – AWR_ADVANCED_FRAME_CONF_SB	86
5.5.7	Sub block 0x0106 – AWR_PERCHIRPPHASESHIFT_CONF_SB	98
5.5.8	Sub block 0x0107 – AWR_PROG_FILT_COEFF_RAM_SET_SB	99
5.5.9	Sub block 0x0108 – AWR_PROG_FILT_CONF_SET_SB	100
5.5.10	Sub block 0x0109 – AWR_CALIB_MON_TIME_UNIT_CONF_SB	101
5.5.11	Sub block 0x010A – AWR_RUN_TIME_CALIBRATION_CONF_AND_TRIGGER_SB	103
5.5.12	Sub block 0x010B – AWR_DIGITAL_COMP_EST_CONTROL_SB	110
5.5.13	Sub block 0x010C – AWR_RX_GAIN_TEMPLUT_SET_SB	113
5.5.14	Sub block 0x010D – AWR_TX_GAIN_TEMPLUT_SET_SB	114
5.5.15	Sub block 0x010E – AWR_LOOPBACK_BURST_CONF_SET_SB	117
5.5.16	Sub block 0x010F – AWR_DYN_CHIRP_CONF_SET_SB	123
5.5.17	Sub block 0x0110 – AWR_DYN_PERCHIRP_PHASESHIFTER_CONF_SET_SB	125
5.5.18	Sub block 0x0111 – AWR_DYN_CHIRP_ENABLE_SB	127
5.5.19	Sub block 0x0112 – AWR_INTERCHIRP_BLOCKCONTROLS_SB	128
5.5.20	Sub block 0x0113 – AWR_SUBFRAME_START_CONF_SB	130
5.5.21	Sub block 0x0115 – AWR_ADVANCE_CHIRP_CONF_SB	132
5.5.22	Sub block 0x0116 – AWR_ADVANCE_CHIRP_GENERIC_LUT_LOAD_SB	144
5.5.23	Sub block 0x0117 – AWR_MONITOR_TYPE_TRIG_CONF_SB	151
5.6	Sub blocks related to AWR_RF_DYNAMIC_CONF_GET_SB	154
5.6.1	Sub block 0x0120 – AWR_PROFILE_CONF_GET_SB	154
5.6.2	Sub block 0x0121 – AWR_CHIRP_CONF_GET_SB	155
5.6.3	Sub block 0x0122 – AWR_FRAME_CONF_GET_SB	155
5.6.4	Sub block 0x0123 – RESERVED	156
5.6.5	Sub block 0x0124 – RESERVED	156
5.6.6	Sub block 0x0125 – AWR_ADV_FRAME_CONF_GET_SB	156
5.6.7	Sub block 0x0126 – RESERVED	156
5.6.8	Sub block 0x0127 – RESERVED	156
5.6.9	Sub block 0x0128 – RESERVED	156
5.6.10	Sub block 0x0129 – RESERVED	156
5.6.11	Sub block 0x012A – RESERVED	156

5.6.12	Sub block 0x012B – RESERVED	156
5.6.13	Sub block 0x012C – AWR_RX_GAIN_TEMPLUT_GET_SB	156
5.6.14	Sub block 0x012D – AWR_TX_GAIN_TEMPLUT_GET_SB	157
5.7	Sub blocks related to AWR_FRAME_TRIG_MSG	157
5.7.1	Sub block 0x0140 – AWR_FRAMESTARTSTOP_CONF_SB	157
5.8	Sub blocks related to AWR_RF_ADVANCED_FEATURES_CONF_SET_MSG	158
5.8.1	Sub block 0x0180 – AWR_BPM_COMMON_CONF_SET_SB	158
5.8.2	Sub block 0x0181 – AWR_BPM_CHIRP_CONF_SET_SB	159
5.9	Sub blocks related to AWR_RF_STATUS_GET_MSG	160
5.9.1	Sub block 0x0220 – AWR_RF_VERSION_GET_SB	160
5.9.2	Sub block 0x0221 – AWR_RF_CPUFAULT_STATUS_GET_SB	162

Revision History

Revision	Date	Description
2.0 (AWR2243)	19.08.2019	<ol style="list-style-type: none">1. Base-lined from AWR1243 DFP 1.2.5 release (mmWave Radar Interface Control Document v1.7)2. Added new parameter MISC_FUNC_CTRL to disable dither in test source configuration API at 177.3. Added new parameter to enable VMON in analog monitor configuration API at 327.4. Added new error code 160 in 310.5. Added new TX Phase shifter DAC monitor settings and reports in TX internal analog signal monitors at 364 and 235.6. updated RX gain temperature LUT RF gain code description at 113.7. updated OSCCLKOUT_DIS description in channel config API 46.

Revision	Date	Description
2.1	10.09.2019	<ol style="list-style-type: none">1. Added a new device AWR2243 and its features in ICD.2. Added new feature INTFRC_MASTER_EN bit in CASCADING_PINOUTCFG field in channel config API in page 46.3. Added a new API AWR_APLL_SYNTH_BW_CONTROL_SB in page 63.4. Added a new field LODIST_BIAS_CODE in API AWR_CAL_DATA_SAVE_SB in page 64.5. Updated AWR_PROFILE_CONF_SET_SB API to include AWR2243 features in page 69.6. Added a new feature MONITORING_MODE in AWR_CALIB_MON_TIME_UNIT_CONF_SB in page 101.7. Added a new feature CAL_TEMP_INDEX_OVERRIDE_ENABLE in AWR_RUN_TIME_CALIBRATION_CONF_AND_TRIGGER_SB in page 103.8. Added a new API AWR_ADVANCE_CHIRP_CONF_SB in page 132.9. Added a new API AWR_MONITOR_TYPE_TRIG_CONF_SB in page 151.10. Added a new bootup and latent fault DCC monitor feature in page 167, 289, 324.11. Added a new feature MONITOR_CONFIG_MODE in AWR_MONITOR_SYNTHESIZER_FREQUENCY_CONF_SB in page 358.12. Added a new Async Event AWR_AE_RF_MONITOR_TYPE_TRIGGER_DONE_SB in page 197.13. Added a new Async Event AWR_MONITOR_SYNTHESIZER_FREQUENCY_NONLIVE_REPORT_AE_SB in page 245.14. Added a new parameter DIS_LINE_START_END in AWR_DEV_CSI2_CFG_SET_SB in page 258.15. Added a new API AWR_DEV_RF_DEBUG_SIG_SET_SB in page 271.16. Added a new API AWR_DEV_CSI2_DELAY_DUMMY_CFG_SET_SB in page 271.

Revision	Date	Description
2.2	23.09.2019	<ol style="list-style-type: none">1. Added a new RX FE disable option in LOOPBACK_SEL in AWR_LOOPBACK_BURST_CONF_SET_SB API in page 1172. Updated LPF monitoring threshold and reporting values in AWR_MONITOR_RX_IFSTAGE_CONF_SB API and AWR_MONITOR_RX_IFSTAGE_REPORT_AE_SB AE in page 336 and 2163. Changed name of AWR_INTER_RX_GAIN_PHASE_CONTROL_SB to AWR_DIGITAL_COMP_EST_CONTROL_SB API and updated the fields in page 1104. Removed AWR_AE_MSS_VMON_ERRORSTATUS_SB Subblock (0x5009)5. Removed VCO slope monitoring in AWR_MONITOR_PLL_CONTROL_VOLTAGE_REPORT_AE_SB for all devices 2416. Added a new enable control SYNTH_FREQ_MONITOR_NON_LIVE for non-live synth frequency monitor in AWR_MONITOR_ANALOG_ENABLES_CONF_SB in page 3277. Updated calibration and monitoring duration for AWR2243 device in page 3988. The TXOFF BPM control bits made reserved in AWR_BPM_CHIRP_CONF_SET_SB API in page 159

Revision	Date	Description
2.3	18.10.2019	<ol style="list-style-type: none">1. Updated Calibration structure definition for AWR2243 and IWR6843 devices in page 64 and 662. Updated few API descriptions and added new error codes for Synth frequency monitor.

Revision	Date	Description
2.4	27.11.2019	<ol style="list-style-type: none"> 1. Updated AWR_ADVANCE_CHIRP_CONF_SB API definition to support more flexible waveform generation in page 132 2. Added new AWR_ADVANCE_CHIRP_GENERIC_LUT_LOAD_SB API to load Advance chirp SW generic LUT data in page 144 3. Added new Advance chirp enable flag in AWR_RF_RADAR_MISC_CTL_SB API in page 55 4. Updated the definition of CHIRP_START_INDX, CHIRP_END_INDX and NUM_LOOPS in AWR_FRAME_CONF_SET_SB and AWR_ADVANCED_FRAME_CONF_SB APIs for new Advance chirp config API in page 79 and 86 5. Added new noise power report fields in AWR_MONITOR_TX_GAIN_PHASE_MISMATCH_REPORT_AE_SB AE in page 224 6. Updated few API descriptions and added new error codes for new advanced chirp configuration APIs. 7. Added new frame stop features in AWR_FRAMESTARTSTOP_CONF_SB API in page 157 8. Added new notes in AWR_CAL_MON_FREQUENCY_LIMITS_SB and AWR_CAL_MON_FREQUENCY_TX_POWER_LIMITS_SB APIs in page 59 9. Added new LODIST calibration data variable in AWR2243 Calibration structure in page 64 10. Added new notes related to minimum chirp cycle time in AWR_PROFILE_CONF_SET_SB API in page 69 11. Updated notes related to minimum burst time in AWR_FRAME_CONF_SET_SB and AWR_ADVANCED_FRAME_CONF_SB APIs in page 79 and 86 12. Added new error codes in AWR_AE_RF_CPUFAULT_SB API in page 190 13. Added dither feature in AWR_DEV_CSI2_DELAY_DUMMY_CFG_SET_SB API in page 271 14. Updated API programming sequence section in page 302 15. Updated Table 5.14 in AWR_APLL_SYNTH_BW_CONTROL_SB API. 16. Updated RF gain settings and description in AWR_PROFILE_CONF_SET_SB in page 69 17. Updated RF gain phase monitor report description in AWR_MONITOR_RX_GAIN_PHASE_REPORT_AE_SB in page 209 18. Added new fault types in AWR_AE_MSS_CPUFAULT_SB API in page 291

Revision	Date	Description

Updated Programmable filter description for AWR2243 in AWR_PROG_FILT_COEFF_RAM_SET_SB API in page 99

NOTE1: Please refer latest mmWave device DFP release notes for all known issues and de-featured APIs

NOTE2: All reserved bytes/bits in configuration API sub blocks shall be programmed with value zero. The functionality of radar device is not guaranteed if reserved bytes are not zero.

NOTE3: All reserved bytes/bits in API message reports (ack or AE) sub blocks shall be masked off in application.

1 Introduction

1.1 Scope

The Scope of this document is to define interface control specifications for 2nd generation TI AWR2243 mmWave sensor device. AWR2243 is an enhanced version of AWR1243 device, all the features/APIs of AWR1243 are supported and applicable in AWR2243 (Backward Compatible), however very few of them are modified for enhancement.

The key differentiated new features in AWR2243 are:

1. 5GHz RF bandwidth support in VCO2
2. 20MHz Max IF Bandwidth and Max 45Msps sample rate support
3. API to configure APLL and SYNTH bandwidth and max slope support upto 500MHz/us
4. New programmable filter support
5. Improved analog RX front end noise figure and gain settings
6. Improved 20GHz cascade link budget and new APIs to support cascade system solution
7. New Advance flexible waveform generation API can support up-to 2048 unique chirps in a burst/frame
8. Various new API features are listed in Appendix A

The wide range of TI highly integrated 77GHz and 60GHz CMOS TI mmwave sensors are tabulated in table 1.1. The mmWave device integrates all RF and Analog functionalities including VCO, PLL, PA, LNA, Mixer and ADC for multiple TX/RX channels into a single chip with integrated cortex R4 for programmability. The AWR2243 is a RF transceiver front end device includes 4 receiver channels and 3 transmit channels in a single chip with inbuilt calibrations and monitoring capability, this device supports multi-chip cascading and supports various features which can be controlled over API through SPI interface.

The device includes a Radar Sub-System (RadarSS) also called Built-in Self-Test (BSS) processor, which is responsible to configure the RF/Analog and digital front-end in real-time, as well as to periodically schedule calibration and functional safety monitoring. This enables the mmWave front-end to be self-contained and capable of adapting itself to handle temperature and ageing effects, and to enable significant ease-of-use from an external host perspective.

This document contains the Interface Control Specification for communications on the serial interface (SPI) between the Radar device and the external host processor. The same protocol is used in all devices when the messages are sent to Radar Control subsystem (BIST subsystem)

from the MCU subsystem (Master subsystem) and DSP subsystems.

Refer Link <http://www.ti.com/sensors/mmwave/overview.html> for more informations.

Table 1.1: TI CMOS mmWave radar devices

Frequency Type	60GHz RF Frequency (57GHz to 64GHz)	77GHz RF Frequency (76GHz to 81GHz)
TI Automotive Radar Devices	NA	AWR1243, AWR1642, AWR1443, AWR1843, AWR2243
TI Industrial Radar Devices	IWR6843	IWR1642, IWR1443, IWR1843

1.2 Intended Audience

The intended audience for this document is firmware, host software, and validation engineers needing to understand the format and contents of all communications between the Radar AWR2243 device and the host processor.

2 TI mmWave Radar Sensor Communications Overview

2.1 Communication Link Description

The AWR2243 radar device communicates with the external host processor using the SPI interface. The radar device is configured and controlled from the external host processor by sending commands to AWR2243 device over SPI.

The xWR1642, xWR1843 and xWR6843 radar device is configured and controlled using the internal MCU (Master subsystem) and it communicates with an external ECU using the CAN interface.

This document only talks about the communication protocol between radar device and external host processor using SPI in AWR2243. In xWR1642, xWR1843 and xWR6843 the same protocol is used to communicate between the BIST subsystem and Master subsystem.

2.2 Communication Link configuration

2.2.1 SPI

This interface is synchronous. The interface includes four signals (SPICCLK, SPICS, and Data In and Data Out) and supports clock rates up to 40 MHz. The AWR2243 radar device is always the SPI slave and the external host processor will be the SPI master.

2.2.2 Mailbox

This interface includes a SRAM and an interrupt line from Master subsystem to BIST subsystem. A reverse channel which includes a different SRAM and a different interrupt line from the BIST subsystem to Master subsystem is used for responses which originate from BIST subsystem.

Figure 2.1: AWR12xx, AWR22xx Software Architecture

Figure 2.2: xWR16xx, xWR18xx and IWR68xx Software Architecture

2.3 Radar Message Structure

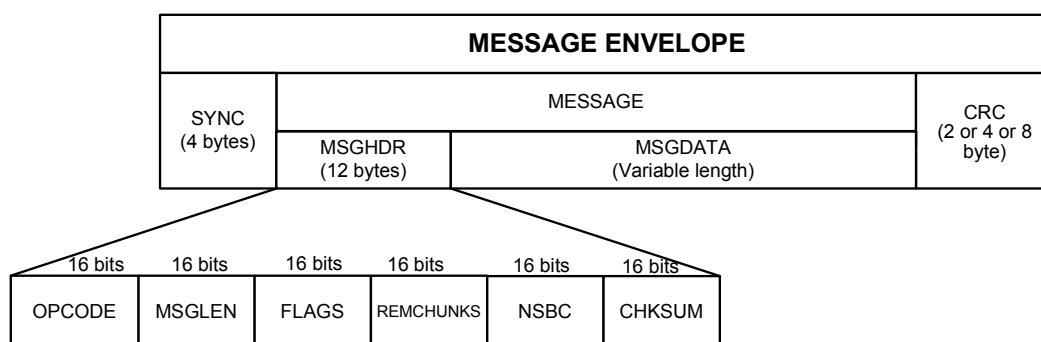

Figure 2.3: Radar Message Structure

Each message is sent in a message envelope, which starts with four special bytes called a sync pattern. Next, the message envelope contains the actual message and a CRC converted to a stream of bytes. Figure 2.3 defines the general form of radar messages. All communication messages between external host processor and the radar device will follow this message format. Each message consists of a 12-byte message header, variable length message data followed by a variable length CRC.

NOTE: The CRC and all the fields in the message headers and message data that are larger than one byte are sent in little-endian byte order i.e. the least significant byte is sent first.

A message envelope contains only one message.

2.3.1 SYNC

SYNC is a unique 4 byte pattern which marks the start of the message. It can take one of the following 3 values, in memory all the bytes are stored in little endian format (least significant byte first).

Table 2.1: Possible SYNC values and their usage

SYNC word value	Description
0x43211234	Messages from master to slave indicating a new command
0x87655678	Messages from external host to device indicating the host is now ready to receive a message from the device This pattern is defined as CNYS in this document.
0xABCDDCBA	Messages from slave to master

2.3.2 MSGHDR

Figure 2.4 defines the content of the message header. Each radar message must begin with this 12 byte message header in little endian format.

OPCODE (16 bits)	LENGTH (16 bits)	FLAGS (16 bits)	REMCHUNKS (16 bits)	NSBC (16 bits)	CHKSUM (16 bits)

Figure 2.4: Message Header Format

		0x20D	RESERVED
		0x280	AWR_DEV_ASYNC_EVENT_MSG

LENGTH

The length field contains the length of the message in bytes including the message header, message data and CRC. Note that length field does not include the length of the sync field. The minimum length of the message is 12 bytes and maximum is 252 bytes. The message length minus CRC length must also be a multiple of 4 bytes.

Figure 2.6: MSGLEN Format

Table 2.3: MSGLEN field descriptions

Bits	Field	Description
[11:0]	LEN	Message length in bytes (It includes message header, message data and CRC)
[15:12]	RESERVED	Keep these bits as 0s

FLAGS

The FLAGS is used to control the communication between the radar device and external host

Figure 2.7: FLAGS Format

Table 2.4: FLAGS field description

Bits	Field	Description
[1:0]	RETRY	RETRY Value 00 New message 11 Retransmitted message 01 RESERVED 10 RESERVED
[3:2]	ACKREQ	Acknowledgement Request type 00 Acknowledgement is requested for the current message 11 Acknowledgement is not requested for the current message 01 RESERVED 10 RESERVED

Continued on next page

Table 2.4 – continued from previous page

[7:4]	PROTOCOL VERSION	Version number of the protocol that is used to communicate with the device (4 bits)
[9:8]	CRCREQ	CRC request type 00 CRC is appended to the message 11 CRC is not appended to the message 01 RESERVED 10 RESERVED
[11:10]	CRCLEN	Length of CRC appended to the message 00 16-bit CRC 01 32-bit CRC 10 64-bit CRC 11 RESERVED
[15:12]	SEQNUM	4 bit sequence number of the message. Sequence number is reset to 0 after a device boot and each new message has the incremented sequence number. Whenever the same message is retransmitted, the sequence number is not incremented.

NOTE: It is recommended to always append CRC to the message to prevent any message integrity issues

REMCHUNKS

If the message length is larger than 256 bytes, then it is split into multiple chunks of sizes less than 256 bytes. When this field is non-zero, this field indicates the number of remaining chunks that are to be expected.

NSBC

The message may contain several configuration sub blocks with structure as defined in Figure 2.3. The NSBC field indicates the total number sub blocks inside the message data.

Figure 2.8: NSBC Format

Table 2.5: NSBC field description

Bits	Field	Description
[10:0]	NSBC	Number of sub blocks in the message
[15:11]	RESERVED	Keep these bits as 0s

CHKSUM

The message header is protected by a 16-bit checksum to enable the receiver to check the integrity of the message header. The checksum is computed on MSGHDR only (MSGID, MSGLEN, FLAGS, REMCHUNKS and NSBC fields). Note that SYNC field is not included in checksum calculation.

Checksum is 16-bit one's complement of the one's complement sum of all 16-bit words in the message header (Ref. <https://tools.ietf.org/html/rfc1071>).

For e.g., suppose the message header contents looks like this

Table 2.6: Checksum computation example

Field	Value
OPCODE	0x0281
MSGLEN	0x0800
FLAGS	0x040C
REMCHUNKS	0x0000
NSBC	0x0001
CHKSUM	0xF171

The receiver will compute the checksum as follows $0x0281 + 0x0800 = 0x0A81$.

Then, $0x0A81 + 0x040C = 0x0E8D$.

Then, $0x0E8D + 0x0000 = 0x0E8D$.

Then, $0x0E8D + 0x0001 = 0x0E8E$.

The carry bits generated beyond 16 bits should be added back to result

Ones complement of $0x0E8E$ is $0xF171$ which matches with the received checksum.

2.3.3 MSGDATA

The message data contains the actual message specific data for the message. The message data contains sub blocks with structure as defined in Figure 2.9. More than one sub block can be appended in the MSGDATA to reduce the overall communication latency. The total number of sub blocks in MSGDATA is indicated in the NSBC field in the MSGHDR.

All data fields are aligned so that their offset in message is a multiple of the field size in bytes. For e.g. a 32 bit field in the message will be aligned to a 4 byte boundary and a 16 bit field will

be aligned to a 2 byte boundary. This makes it possible to create a structure definition for the message for easy data access in most environments.

Any reserved (currently unused) fields in the messages should be always set as 0 when sent and ignored when received. This way those fields may be taken to use in later interface versions without modifying all old software.

All data structure in sub-blocks assumed to be in little endian format. For big endian Host system byte swap is required to match with defined protocol.

Figure 2.9: Message Sub block structure

SBLKID Unique ID of the sub block

SBLKLEN Length of the sub block in bytes

SBLKDATA Data corresponding to the sub block

2.3.4 CRC

This is a CRC which is appended to the message data to protect the integrity of the message. The CRC is computed on all the bytes in the MSGHDR and MSGDATA. Note that SYNC is not included in CRC calculation.

3 different types of CRCs can be used – 16 bit, 32 bit or 64 bit. The choice of the CRC type is indicated in the FLAGS field in the MSGHDR.

The 32 bit CRC is recommended CRC to be used in SPI protocol.

The polynomials used for each type of CRC calculation are

Table 2.7: CRC types and their polynomials

CRC type	Polynomial	Remarks
16 bit	$x^{16} + x^{12} + x^5 + 1$	16-bit CRC-CCITT
32 bit	$x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$	CRC-32 (used in Ethernet)
64 bit	$x^{64} + x^4 + x^3 + x + 1$	CRC-64-ISO (HDLC)

NOTE: Device SPI protocol Limitation: The CRC length of the message or Async-event shall be multiple of 4 bytes to enable reliable retry recovery mechanism in case of any checksum failure in a message.

3 Message Processing

3.1 Communication protocol

When requested by the message transmitter, all correctly formatted radar messages are acknowledged by the receiver. This request for an acknowledgement is specified in FLAGS field of the MSGHDR (message header) field (see Section 2.3.2). A correctly formatted message is one that is formatted properly with a SYNC, MSGHDR, MSGDATA and CRC and that passes the CRC test when received. If an incorrectly formatted message is received, the radar device responds with a NACK message (MSGTYPE field in the MSGHDR set to NACK response). If a correctly formatted message is received, and after processing the message no errors are encountered, the radar device responds with an ACK response. In case of errors on a correctly formatted message, the radar device responds with an ERROR response.

The ACK response is a radar message which contains SYNC, MSGHDR, MSGDATA and CRC. In case the MSGTYPE was COMMAND_GET the MSGDATA for ACK response will contain the parameter values read by the radar device.

The NACK response is a radar message with only SYNC, MSGHDR and CRC. It does not contain MSGDATA.

For most commands the radar device prepares the acknowledgments and response packets immediately on reception. In certain cases, higher priority events in the system delay the execution of external communication function. The response time to command is a function of:

- Speed of the selected communication channel
- Although typical radar command/response occurs within a few hundreds of microseconds, it is recommended that host software wait up to 1 millisecond for response or acknowledgment before timing out on nonresponse.

The radar communication protocol is defined as follows

1. The host sends a message to the radar device requesting an acknowledgement. Host sets a timeout period of 1 ms for a response from the radar device.
2. The radar device checks the CHKSUM field for Message header validity and checks the MSGDATA field for correctness and also computes the CRC of the message and compares it with the received CRC.
 - If the computed CHKSUM does not match the received CHKSUM, the radar device does not send any response. The transmitter will timeout and eventually resend the command again with RETRY flag set

- If the CRC matches and all parameters are valid/correct, the radar device sends an ACK to the host
 - If the CRC matches, but any parameter in the message is invalid/incorrect, then the radar device sends an ERROR response to the host
 - If the CRC does not match, the radar device sends a NACK response to the host
3. On reception of the ACK, the host can send the next command to the radar device.
 4. If the host receives a NACK from the radar device within the timeout period, it sends the message again without the RETRY flag set.
 5. If the host does not receive any response from the radar device within the timeout period then it sends the same command with the RETRY flag set.

3.2 Communication Sequence

3.2.1 Command/Response Sequence (Host)

1. Host prepares the message as defined by protocol in Section 2.3
2. Host writes the message to the communication channel and starts Retry Timer (~1 ms)
3. Host then waits for HOST IRQ high Interrupt
 - a. If IRQ is received, go to Step 4
 - b. If Retry Time expires, Enable Retry Flag and go to Step 2
4. Host writes CNYS (SYNC word = 0x5678 0x8765) and Dummy bytes (0xFFFF 0xFFFF 0xFFFF 0xFFFF 0xFFFF 0xFFFF) on communication channel
5. Host waits for low on Host IRQ line
 - a. If Host IRQ line is low, go to Step 6
 - b. If Retry Time expires, Flag Error
6. Host reads the header from communication channel
7. Host checks the validity of header (verify checksum)
 - a. If header is valid, parse the header and go to Step 8
 - b. If header is invalid, ignore the header and reports to error to Application
8. Host reads the payload from communication channel
9. Host checks the validity of the message (verify CRC)
 - a. If message is valid, process the message
 - b. If message is invalid, go to Step 2 with new sequence number

3.2.3 Flow Diagram (Host) – Bootup/ Asynchronous Event

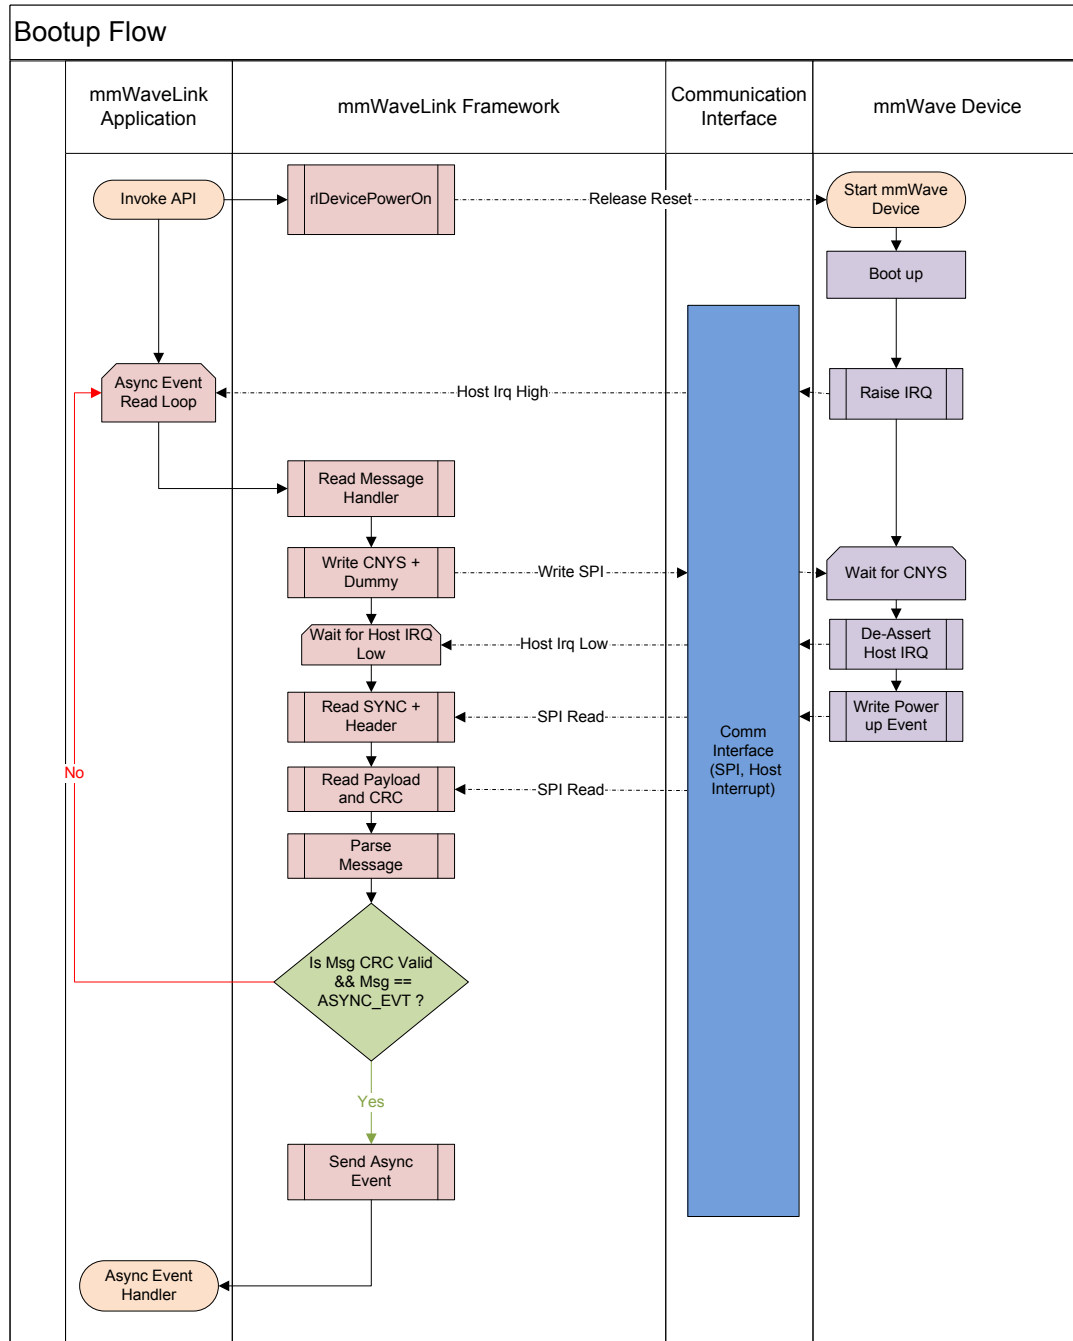

Figure 3.2: Flow Diagram (Asynchronous Events)

3.2.4 SPI Message Sequence – Command/Response

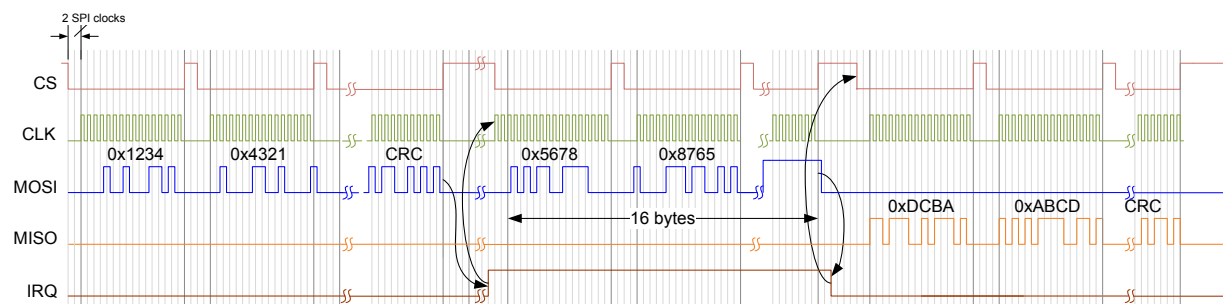

Figure 3.3: SPI Message Sequence

NOTE:

1. Host should ensure that there is a delay of at least 2 SPI clocks between CS going low and start of SPI clock
2. Host should ensure that CS is toggled for every 16 bits of transfer via SPI
3. There should be a delay of at least 2 SPI Clocks between consecutive CS
4. SPI needs to be operated at Mode 0 (Phase 1, Polarity 0)
5. SPI word length should be 16 bit (Half word)

4 Radar Interface Messages Descriptions

This section describes all the radar interface messages that are used in communication with the radar transceiver.

4.1 Summary of all messages and their associated sub-blocks

4.2 AWR_ACK_MSG

The AWR_ACK_MSG is sent by the radar transceiver on a successful reception of a command after its CRC check.

Field Name	Number of bytes	Description												
SYNC	4	Value = 0xABCDDCBA												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>01</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>Same as MSGID in the command</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	01	b15:6	MSGID	Same as MSGID in the command
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	01												
b15:6	MSGID	Same as MSGID in the command												
MSGLEN	2	Length of the message in bytes (do not include sync length)												
FLAGS	2	See Section 2.3.2												
REMCHUNKS	2	Value = 0												
NSBC	2	Number of sub blocks contained in the message												
CHKSUM	2	See Section 2.3.2												
CRC	Variable	Based on CRCLen field in FLAGS												

4.3 AWR_NACK_MSG

The AWR_NACK_MSG is sent by the radar transceiver if the CRC check of the command fails.

Field Name	Number of bytes	Description												
SYNC	4	Value = 0xABCDDCBA												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>10</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>Same as MSGID in the command</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	10	b15:6	MSGID	Same as MSGID in the command
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	10												
b15:6	MSGID	Same as MSGID in the command												
MSGLEN	2	Length of the message in bytes (do not include sync length)												
FLAGS	2	See Section 2.3.2												
REMCHUNKS	2	Value = 0												
NSBC	2	Number of sub blocks contained in the message												

CHKSUM	2	See Section 2.3.2
CRC	Variable	Based on CRCLLEN field in FLAGS

4.4 AWR_ERROR_MSG

The AWR_RF_ERROR_MSG is sent by the radar transceiver on finding errors in the command send by host.

Field Name	Number of bytes	Description												
SYNC	4	Value = 0xABCDDCBA												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>01</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x00</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	01	b15:6	MSGID	0x00
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	01												
b15:6	MSGID	0x00												
MSGLEN	2	Length of the message in bytes (do not include sync length)												
FLAGS	2	See Section 2.3.2												
REMCHUNKS	2	Value = 0												
NSBC	2	Number of sub blocks contained in the message												
CHKSUM	2	See Section 2.3.2												
MSGDATA	Variable	Supported sub blocks AWR_RESP_ERROR_SB												
CRC	Variable	Based on CRCLLEN field in FLAGS												

4.5 AWR_RF_STATIC_CONF_SET_MSG

Field Name	Number of bytes	Description												
SYNC	4	Value = 0x43211234												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>00</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x04</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	00	b15:6	MSGID	0x04
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	00												
b15:6	MSGID	0x04												

MSGLEN	2	Length of the message in bytes (do not include sync length)
FLAGS	2	See Section 2.3.2
REMCHUNKS	2	Value = 0
NSBC	2	Number of sub blocks contained in the message
CHKSUM	2	See Section 2.3.2
MSGDATA	Variable	Supported sub blocks AWR_CHAN_CONF_SET_SB AWR_ADCOUT_CONF_SET_SB AWR_LOWPOWERMODE_CONF_SET_SB AWR_DYNAMICPOWERSAVE_CONF_SET_SB AWR_HIGHSPEEDINTFCLK_CONF_SET_SB AWR_RF_DEVICE_CFG_SB AWR_RF_RADAR_MISC_CTL_SB AWR_CAL_MON_FREQUENCY_LIMITS_SB AWR_RF_INIT_CALIBRATION_CONF_SB AWR_CAL_MON_FREQUENCY_TX_POWER_LIMITS_SB AWR_CAL_DATA_RESTORE_SB AWR_PHASE_SHIFTER_CAL_DATA_RESTORE_SB AWR_APLL_SYNTH_BW_CONTROL_SB
CRC	Variable	Based on CRCLen field in FLAGS

4.6 AWR_RF_STATIC_CONF_GET_MSG

Field Name	Number of bytes	Description												
SYNC	4	Value = 0x43211234												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>00</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x05</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	00	b15:6	MSGID	0x05
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	00												
b15:6	MSGID	0x05												

MSGLEN	2	Length of the message in bytes (do not include sync length)
FLAGS	2	See Section 2.3.2
REMCHUNKS	2	Value = 0
NSBC	2	Number of sub blocks contained in the message
CHKSUM	2	See Section 2.3.2
MSGDATA	Variable	Supported sub blocks AWR_CAL_DATA_SAVE_SB AWR_PHASE_SHIFTER_CAL_DATA_SAVE_SB
CRC	Variable	Based on CRCLLEN field in FLAGS

4.7 AWR_RF_INIT_MSG

Field Name	Number of bytes	Description												
SYNC	4	Value = 0x43211234												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>00</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x06</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	00	b15:6	MSGID	0x06
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	00												
b15:6	MSGID	0x06												
MSGLEN	2	Length of the message in bytes (do not include sync length)												
FLAGS	2	See Section 2.3.2												
REMCHUNKS	2	Value = 0												
NSBC	2	Number of sub blocks contained in the message												
CHKSUM	2	See Section 2.3.2												
MSGDATA	Variable	Supported sub blocks AWR_RF_INIT_SB												
CRC	Variable	Based on CRCLLEN field in FLAGS												

4.8 AWR_RF_DYNAMIC_CONF_SET_MSG

Field Name	Number of bytes	Description
------------	-----------------	-------------

SYNC	4	Value = 0x43211234												
OPCODE	2	<table border="1"> <thead> <tr> <th>Bits</th> <th>Variable name</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>00</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x08</td> </tr> </tbody> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	00	b15:6	MSGID	0x08
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	00												
b15:6	MSGID	0x08												
MSGLEN	2	Length of the message in bytes (do not include sync length)												
FLAGS	2	See Section 2.3.2												
REMCHUNKS	2	Value = 0												
NSBC	2	Number of sub blocks contained in the message												
CHKSUM	2	See Section 2.3.2												
MSGDATA	Variable	Supported sub blocks AWR_PROFILE_CONF_SET_SB AWR_CHIRP_CONF_SET_SB AWR_FRAME_CONF_SET_SB AWR_CONT_STREAMING_MODE_CONF_SET_SB AWR_CONT_STREAMING_MODE_EN_SB AWR_ADVANCED_FRAME_CONF_SB AWR_PERCHIRPPHASESHIFT_CONF_SB AWR_PROG_FILT_COEFF_RAM_SET_SB AWR_PROG_FILT_CONF_SET_SB AWR_CALIB_MON_TIME_UNIT_CONF_SB AWR_RUN_TIME_CALIBRATION_CONF_AND_TRIGGER_SB AWR_DIGITAL_COMP_EST_CONTROL_SB AWR_RX_GAIN_TEMPLUT_SET_SB AWR_TX_GAIN_TEMPLUT_SET_SB AWR_LOOPBACK_BURST_CONF_SET_SB AWR_DYN_CHIRP_CONF_SET_SB AWR_DYN_PERCHIRP_PHASESHIFTER_CONF_SB AWR_DYN_CHIRP_ENABLE_SB AWR_INTERCHIRP_BLOCKCONTROLS_SB AWR_SUBFRAME_START_CONF_SB AWR_ADVANCE_CHIRP_CONF_SB AWR_ADVANCE_CHIRP_GENERIC_LUT_LOAD_SB AWR_MONITOR_TYPE_TRIG_CONF_SB												
CRC	Variable	Based on CRCLLEN field in FLAGS												

4.9 AWR_RF_DYNAMIC_CONF_GET_MSG

Field Name	Number of bytes	Description												
SYNC	4	Value = 0x43211234												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>00</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x09</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	00	b15:6	MSGID	0x09
Bits	Variable name	Value

CRC	Variable	Based on CRCLEN field in FLAGS

4.19 AWR_DEV_RFPOWERUP_MSG

The AWR_DEV_RFPOWERUP_MSG is sent by the host to the MSS. This message indicates that BSS can now be powered up.

Field Name	Number of bytes	Description												
SYNC	4	Value = 0xABCDDBCA												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>00</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x200</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	00	b15:6	MSGID	0x200
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	00												
b15:6	MSGID	0x200												
MSGLEN	2	Length of the message in bytes (do not include sync length)												
FLAGS	2	See Section 2.3.2												
REMCHUNKS	2	Value = 0												
NSBC	2	Number of sub blocks contained in the message												
CHKSUM	2	See Section 2.3.2												

MSGDATA	Variable	Supported sub blocks AWR_DEV_RFPOWERUP_SB
CRC	Variable	Based on CRCLEN field in FLAGS

4.20 AWR_DEV_CONF_SET_MSG

The AWR_DEV_CONF_SET_MSG is sent by the host to the radar transceiver. This message indicates that specific events have occurred within the device.

Field Name	Number of bytes	Description												
SYNC	4	Value = 0x43211234												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>00</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x202</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	00	b15:6	MSGID	0x202
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	00												
b15:6	MSGID	0x202												
MSGLEN	2	Length of the message in bytes (do not include sync length)												
FLAGS	2	See Section 2.3.2												
REMCHUNKS	2	Value = 0												
NSBC	2	Number of sub blocks contained in the message												
CHKSUM	2	See Section 2.3.2												
MSGDATA	Variable	Supported sub blocks AWR_DEV_MCU_CLOCK_CONF_SET_SB AWR_DEV_RX_DATA_FORMAT_CONF_SET_SB AWR_DEV_RX_DATA_PATH_CONF_SET_SB AWR_DEV_RX_DATA_PATH_LANEEN_SET_SB AWR_DEV_RX_DATA_PATH_CLK_SET_SB AWR_DEV_LVDS_CFG_SET_SB AWR_DEV_RX_CONTSTREAMING_MODE_CONF_SET_SB AWR_DEV_CSI2_CFG_SET_SB AWR_DEV_PMIC_CLOCK_CONF_SET_SB AWR_MSS_LATENTFAULT_TEST_CONF_SB AWR_MSS_PERIODICTESTS_CONF_SB AWR_DEV_TESTPATTERN_GEN_SET_SB AWR_DEV_CONFIGURATION_SET_SB												

		AWR_DEV_RF_DEBUG_SIG_SET_SB AWR_DEV_CSI2_DELAY_DUMMY_CFG_SET_SB
CRC	Variable	Based on CRCLLEN field in FLAGS

4.21 AWR_DEV_CONF_GET_MSG

The AWR_DEV_CONF_GET_MSG is sent by the host to the radar transceiver to read back the configuration values.

Field Name	Number of bytes	Description												
SYNC	4	Value = 0x43211234												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>00</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x203</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	00	b15:6	MSGID	0x203
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	00												
b15:6	MSGID	0x203												
MSGLEN	2	Length of the message in bytes (do not include sync length)												
FLAGS	2	See Section 2.3.2												
REMCHUNKS	2	Value = 0												
NSBC	2	Number of sub blocks contained in the message												
CHKSUM	2	See Section 2.3.2												
MSGDATA	Variable	Supported sub blocks AWR_DEV_MCUCLOCK_GET_SB AWR_DEV_RX_DATA_FORMAT_CONF_GET_SB AWR_DEV_RX_DATA_PATH_CONF_GET_SB AWR_DEV_RX_DATA_PATH_LANEEN_GET_SB AWR_DEV_RX_DATA_PATH_CLK_GET_SB AWR_DEV_LVDS_CFG_GET_SB AWR_DEV_RX_CONTSTREAMING_MODE_CONF_GET_SB AWR_DEV_CSI2_CFG_GET_SB AWR_DEV_PMICLOCK_CONF_GET_SB AWR_MSS_LATENTFAULT_TEST_CONF_GET_SB AWR_MSS_PERIODICCONF_GET_SB AWR_DEV_TESTPATTERN_GEN_GET_SB												
CRC	Variable	Based on CRCLLEN field in FLAGS												

4.22 AWR_DEV_FILE_DOWNLOAD_MSG

The AWR_DEV_FILE_DOWNLOAD_MSG is sent by the host to MSS. This message sends a file to be written into the device.

Field Name	Number of bytes	Description												
SYNC	4	Value = 0x43211234												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>00</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x204</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	00	b15:6	MSGID	0x204
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	00												
b15:6	MSGID	0x204												
MSGLEN	2	Length of the message in bytes (do not include sync length)												
FLAGS	2	See Section 2.3.2												
REMCHUNKS	2	Value = 0												
NSBC	2	Number of sub blocks contained in the message												
CHKSUM	2	See Section 2.3.2												
MSGDATA	Variable	Supported sub blocks AWR_DEV_FILE_DOWNLOAD_SB												
CRC	Variable	Based on CRCLLEN field in FLAGS												

4.23 AWR_DEV_FRAME_CONFIG_APPLY_MSG

The AWR_DEV_FRAME_CONFIG_APPLY_MSG is sent by the host to MSS. This message indicates to MSS to apply all the regular framing mode configurations related to ADC buffer and CBUFF.

Field Name	Number of bytes	Description												
SYNC	4	Value = 0x43211234												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>00</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x206</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	00	b15:6	MSGID	0x206
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	00												
b15:6	MSGID	0x206												

MSGLEN	2	Length of the message in bytes (do not include sync length)
FLAGS	2	See Section 2.3.2
REMCHUNKS	2	Value = 0
NSBC	2	Number of sub blocks contained in the message
CHKSUM	2	See Section 2.3.2
MSGDATA	Variable	Supported sub blocks AWR_DEV_FRAME_CONFIG_APPLY_SB AWR_DEV_ADV_FRAME_CONFIG_APPLY_SB
CRC	Variable	Based on CRCLLEN field in FLAGS

4.24 AWR_DEV_STATUS_GET_MSG

The AWR_DEV_STATUS_GET_MSG is sent by the host to MSS to get some status information from the device.

Field Name	Number of bytes	Description												
SYNC	4	Value = 0x43211234												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>00</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x207</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	00	b15:6	MSGID	0x207
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	00												
b15:6	MSGID	0x207												
MSGLEN	2	Length of the message in bytes (do not include sync length)												
FLAGS	2	See Section 2.3.2												
REMCHUNKS	2	Value = 0												
NSBC	2	Number of sub blocks contained in the message												
CHKSUM	2	See Section 2.3.2												
MSGDATA	Variable	Supported sub blocks AWR_MSSVERSION_GET_SB AWR_MSSCPUFAULT_STATUS_GET_SB AWR_MSSSESMFAULT_STATUS_GET_SB												
CRC	Variable	Based on CRCLLEN field in FLAGS												

4.25 AWR_DEV_ASYNC_EVENT_MSG

The AWR_DEV_ASYNC_EVENT_MSG is sent by the radar transceiver to the host. This message indicates that specific events have occurred within the device.

Field Name	Number of bytes	Description												
SYNC	4	Value = 0x43211234												
OPCODE	2	<table border="0"> <tr> <td>Bits</td> <td>Variable name</td> <td>Value</td> </tr> <tr> <td>b3:0</td> <td>DIRECTION</td> <td>See Table 2.2</td> </tr> <tr> <td>b5:4</td> <td>MSGTYPE</td> <td>11</td> </tr> <tr> <td>b15:6</td> <td>MSGID</td> <td>0x280</td> </tr> </table>	Bits	Variable name	Value	b3:0	DIRECTION	See Table 2.2	b5:4	MSGTYPE	11	b15:6	MSGID	0x280
Bits	Variable name	Value												
b3:0	DIRECTION	See Table 2.2												
b5:4	MSGTYPE	11												
b15:6	MSGID	0x280												
MSGLEN	2	Length of the message in bytes (do not include sync length)												
FLAGS	2	See Section 2.3.2												
REMCHUNKS	2	Value = 0												
NSBC	2	Number of sub blocks contained in the message												
CHKSUM	2	See Section 2.3.2												
MSGDATA	Variable	Supported sub blocks AWR_AE_DEV_MSSPOWERUPDONE_SB AWR_AE_DEV_RFPOWERUPDONE_SB AWR_AE_MSS_CPUFAULT_SB AWR_AE_MSS_ESMFAULT_SB AWR_AE_MSS_BOOTERRORSTATUS_SB AWR_AE_MSS_LATENTFAULT_TESTREPORT_SB AWR_AE_MSS_PERIODICTEST_STATUS_SB AWR_AE_MSS_RFERROR_STATUS_SB AWR_AE_MSS_ADC_DATA_SB												
CRC	Variable	Based on CRCLLEN field in FLAGS												

5 Radar Functional APIs

This section describes all the radar interface sub blocks that are used in messages for communicating with the radar transceiver. Some of the sub blocks are status responses from the radar device. All the API sub-blocks defined in this document are applicable to all mmWave Radar Sensors unless it is specified in the sub-block.

5.1 Sub block related to AWR_ERROR_MSG

5.1.1 Sub block 0x0000 – AWR_RESP_ERROR_SB

This sub block contains the error response for an API command. Table 5.1 describes the contents of this sub block.

Table 5.1: AWR_RESP_ERROR_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0000
SBLKLEN	2	Value = 8
API_RESP	2	0x0001 ERROR_CMD: Incorrect MSGID 0x0002 ERROR_CMD: No Sub block found in the MSG 0x0003 ERROR_CMD: Incorrect Sub block ID 0x0004 ERROR_CMD: Incorrect Sub block Length 0x0005 ERROR_CMD: Incorrect Sub block data 0x0006 ERROR_PROC: Error in processing the command 0x0007 ERROR_FILECRCMISMATCH: File CRC mismatched 0x0008 ERROR_FILETYPEMISMATCH: File type mismatched w.r.t. magic number 0x0009 See Section 7 for details on error codes from each API - 0xFFFF

API_RESP_ERROR_SBC_ID	2	0x0000 Sub-Block ID in which Error Occurred for sub-block related errors – 0xFFFF
-----------------------	---	---

5.2 Sub blocks related to AWR_RF_STATIC_CONF_SET_MSG

5.2.1 Sub block 0x0080 – AWR_CHAN_CONF_SET_SB

This sub block contains static device configurations (applicable for the given power cycle) - how many RX and TX channels are needed for operation. It also defines static configurations related to whether the sensor uses a single mmWave or multiple chips to realize a larger antenna array (multiple is applicable only in AWR2243). Table 5.2 describes the contents of this sub block.

Table 5.2: AWR_CHAN_CONF_SET_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0080
SBLKLEN	2	Value = 12

5.2.2 Sub block 0x0082 – AWR_ADCOUT_CONF_SET_SB

This sub block contains static device configurations (applicable for the given power cycle) - regarding the data format of the ADC output (including the digital filtering).

Table 5.3 describes the contents of this sub block.

Table 5.3: AWR_ADCOUT_CONF_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0082
SBLKLEN	2	Value = 12
NUM_ADC_BITS	1	Bit Description b1:0 Value Definition 00 12 bits 01 14 bits 10 16 bits Other RESERVED b7:2 RESERVED 0b000000
FULL_SCALE_REDUCTION_FACTOR	1	Number of bits to reduce ADC full scale by Valid range: 0 to (16 – Number of ADC bits) For e.g. for 12 bit ADC output, this field can take values 0, 1, 2 or 3 For 14 bit ADC output, this field can take values 0, 1 or 2 For 16 bit ADC output, this field can take only value 0 Example: If the user desires 12 bit ADC output, then the digital front end (DFE) chain drops 4 LSBs before placing the data in ADC buffer (DFE output is 16 bits wide). If the user sets FULL_SCALE_REDUCTION_FACTOR as 1, then the DFE will drop only 3 LSBs but still restricting the data in ADC buffer to be within $\pm 2^{12}$. This allows wider ADC swings in smaller signal conditions.

5.2.3 Sub block 0x0083 – AWR_LOWPOWERMODE_CONF_SET_SB

This sub block contains static device configurations (applicable for this power cycle) - Sigma Delta ADC root sampling clock rate (reducing rate to half to save power in small IF bandwidth applications).

Table 5.4 describes the contents of this sub block.

Table 5.4: AWR_LOWPOWERMODE_CONF_SET_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0083
SBLKLEN	2	Value = 8
RESERVED	2	0x0000
LP_ADC_MODE	2	Value Definition
		0x00 Regular ADC mode
		0x01 Low power ADC mode

NOTE: Low power ADC mode is mandatory on a 5 MHz part variant (for e.g. xWR1642), Normally if IF BW \leq 7.5MHz then low power mode setting is recommended.

5.2.4 Sub block 0x0084 – AWR_DYNAMICPOWERSAVE_CONF_SET_SB

This sub block defines static device configuration - whether to enable dynamic power saving during inter-chirp IDLE times by turning off various circuits e.g. TX, RX, LO Distribution blocks. If

Idle time + Tx start time < 10us or Idle time < 3.5us then inter-chirp dynamic power save option will be disabled, in that case, 15us of inter-burst idle time will be utilized to configure sequencer LO, TX and RX signal timings by firmware.

Table 5.4 describes the contents of this sub block.

Table 5.5: AWR_DYNAMICPOWERSAVE_CONF_SET_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0084
SBLKLEN	2	Value = 8
BLOCK_CFG	2	Bits Definition b0 Enable power save by switching off TX during inter-chirp IDLE period 0 Disable 1 Enable Default value: 1 (power saving is enabled) b1 Enable power save by switching off RX during inter-chirp IDLE period 0 Disable 1 Enable Default value: 1 (power saving is enabled) b2 Enable power save by switching off LO Distribution blocks during inter-chirp IDLE period 0 Disable 1 Enable Default value: 1 (power saving is enabled) b15:3 RESERVED 0b00000000000000
RESERVED	2	0x0000

NOTE: All the 3 configuration bits (TX, RX and LO) should have same value, i.e. user should program value 0x7 to enable power save or 0x0 to disable the power save in BLOCK_CFG.

5.2.5 Sub block 0x0085 – AWR_HIGHSPEEDINTFCLK_CONF_SET_SB

This sub block contains static device configurations (applicable for the given power cycle) - regarding high speed interface clock rates which are related to sending the ADC data from AWR device to the host in either LVDS or CSI2 format.

Table 5.6 describes the contents of this sub block.

Table 5.6: AWR_HIGHSPEEDINTFCLK_CONF_SET_SB contents

5.2.13 Sub block 0x008D – AWR_APLL_SYNTH_BW_CONTROL_SB

This is a new feature addition in **AWR2243**. This sub block is used to control bandwidth of the APLL and Synthesizer. The typical recommended settings are as below.

Table 5.14: Typical APLL and Synth BW settings

SYNTH_ICP_TRIM	SYNTH_RZ_TRIM	APLL_ICP_TRIM	APLL_RZ_TRIM	VCO1_BW	VCO2_BW	APLL_BW	Description	Max VCO Slope (MHz/us)
1	8	0x26	0x9	750K	1.5M	150K	Default settings (+/-0.2% Ferror at 2us ADC start)	266
3	8	0x26	0x9	375K	750K	150K	Optimum for 76-77GHz VCO1 (1M, 10M PN)	100
0	8	0x26	0x9	1.3M	2.6M	150K	Synth High BW (+/-0.2% Ferror at 1us ADC start)	266
3	8	0x3F	0x9	375K	1.5M	300K	Optimum 100K PN	100

Table 5.15: AWR_APLL_SYNTH_BW_CONTROL_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x008D
SBLKLEN	2	Value = 20
SYNTH_ICP_TRIM	1	Synth ICP trim code
SYNTH_RZ_TRIM	1	Synth RZ trim code
APLL_ICP_TRIM	1	APLL RZ trim code
APLL_RZ_TRIM	1	APLL RZ trim code
RESERVED	12	0x0000

NOTE: Recommended to issue this AWR_APLL_SYNTH_BW_CONTROL_SB API before AWR_RF_INIT_SB API. The RF_INIT synthesizer boot calibration shall run after changing the APLL BW.

5.3 Sub blocks related to AWR_RF_STATIC_CONF_GET_MSG

5.3.1 Sub block 0x00A0 – 0x00AA – RESERVED

5.3.2 Sub block 0x00AB – AWR_CAL_DATA_SAVE_SB

This sub block reads the calibration data from the device which can be injected later using the AWR_CAL_DATA_RESTORE_SB command.

NOTE: The total size of the calibration data is 672 bytes, this has been split into 3 chunks (NUM_CHUNKS) of 224 bytes each due to SPI limitation. The Host should receive all these 3 chunks from radar device, later host can store only relevant data in non volatile memory.

Table 5.16: AWR_CAL_DATA_SAVE_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x00AB
SBLKLEN	2	Value = 8
RESERVED	2	0x0000
CHUNK_ID	2	Index of the requested chunk Valid values: 0 to NUM_CHUNKS - 1

Response to the above command will contain the calibration data which is formatted as shown below

Table 5.17: AWR_CAL_DATA_SAVE_SB response packet contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x00AB
SBLKLEN	2	Value = 232
NUM_CHUNKS	2	Total number of calibration data chunks
CHUNK_ID	2	Current chunk number
CAL_DATA	224	Calibration data, refer CAL_DATA contents below

NOTE1:	Before storing the calibration data in non volatile memory, the host shall make sure validity status of all enabled calibrations are SET to value 1 including APLL, VCO1, VCO2 and LODIST calibration validity in RF_INIT of radar device.
NOTE2:	Host can store only relevant calibration data in non volatile memory and corresponding validity bits shall be set to 1 in AWR_CAL_DATA_RESTORE_SB and rest of the validity bits should be clear to 0 before restoring the data to radar device.
NOTE3:	Host shall ignore APLL, VCO1, VCO2 and LODIST calibration validity bits while restoring, these calibrations will be done in each device power-up.

5.3.3 Sub block 0x00AC – AWR_PHASE_SHIFTER_CAL_DATA_SAVE_SB

This sub block reads the phase shifter calibration data from the device which can be injected later using the AWR_PHASE_SHIFTER_CAL_DATA_RESTORE_SB command. This is device specific feature, please refer data sheet.

Table 5.20: AWR_PHASE_SHIFTER_CAL_DATA_SAVE_SB contents

5.4 Sub blocks related to AWR_RF_INIT_MSG

5.4.1 Sub block 0x00C0 – AWR_RF_INIT_SB

This sub block, needed to be initially issued, triggers one time calibrations such as those related to APLL and synthesizer. The BSS processor is woken up upon receiving this sub block, the RF analog and digital baseband sections are initialized.

Table 5.22 describes the content of this sub block.

Table 5.22: AWR_RF_INIT_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x00C0
SBLKLEN	2	Value = 4

NOTE1: This sub block will be acknowledged immediately but an async event [AWR_AE_RF_INITCALIBSTATUS_SB](#) from BSS will indicate that the RF initialization is complete. No commands shall be sent to BSS till the async event is received.

NOTE2: It is not recommended to issue this API in runtime multiple times. This API shall be issued only once after power cycle with or without calibration data restore operation.

NOTE2: The following boot-time calibrations are susceptible to corruption by interference. The calibrations may result in false configuration of the RF analog sections due to corruption by interference during the calibration measurements.

- a. RX gain calibration (susceptible to interference)
- b. RX IQMM calibration (susceptible to interference)
- c. TX Phase calibration (susceptible to interference)

It is recommended to perform factory calibration and store the calibration data in non volatile memory using [AWR_CAL_DATA_SAVE_SB](#) API. This data can be restored to radar device using [AWR_CAL_DATA_RESTORE_SB](#) API. More info related to save restore provided in page [64](#)

5.5 Sub blocks related to AWR_RF_DYNAMIC_CONF_SET_MSG

5.5.1 Sub block 0x0100 – AWR_PROFILE_CONF_SET_SB

This sub block contains FMCW radar chirp profiles or properties (FMCW slope, chirp duration, TX power etc.). Since the device supports multiple profiles, each profile is defined in this sub

block. Internal RF and analog calibrations may be triggered upon receiving this sub block and ASYNC_EVENT response sent once completed.

NOTE: This API can be issued dynamically to change profile parameters. Few parameters which cannot be changed are

1. PF_NUM_ADC_SAMPLES
2. PF_DIGITAL_OUTPUT_SAMPLING_RATE
3. Programmable filter coefficients

Table 5.23 describes the contents of this sub block.

Table 5.23: AWR_PROFILE_CONF_SB contents

Field Name	Number of bytes	Description

Table 5.23 – continued from previous page

		<p>The total RX gain is achieved as a sum of RF gain and IF amplifiers gain. The RF Gain Target (30 dB, 33 dB and 36 dB) allows the user to control the RF gain independently from the total RX gain, thus giving flexibility to the user to trade-off linearity vs. noise figure. Out of multiple gain settings for the RF stages, the firmware calibration algorithm uses the one that makes the RF gain as close as possible to the user programmed RF Gain Target.</p> <p>At high temperatures, the RF Gain Targets provide trade-off of approximately 4 dB in RF P1dB point vs 2 dB in noise figure.</p> <p>For the lowest RF Gain Target setting 30 dB, the RF gain varies linearly from 38 dB at -40C to 30 dB at 140C for nominal process corner. Since the minimum IF gain is -6 dB, The minimum achievable RX Gain varies from 32 dB at -40C to 24 dB at 140C.</p> <p>The maximum RX gain setting is recommended to be limited to 48dB, which can be achieved at all temperatures and RF gain target conditions. Increasing RX gain beyond 48 dB may result in degradation of in-band P1dB without improvement in noise figure.</p>
RESERVED	2	0x0000

- NOTE1:** Please refer Table 11.1 for details on minimum chirp duration.
- NOTE2:** The max TX output power back-off only up to 20dB is supported.
- NOTE3:** The RF band used in functional chirp profiles shall be within the limit set in [AWR_CAL_MON_FREQUENCY_TX_POWER_LIMITS_SB](#) API.
- NOTE4:** This API takes around 700us to execute in RadarSS sub System.

Table 5.24: Note on maximum sampling rate

NOTE:

The maximum sampling rate supported is limited based on the information in the table below

When device supports 15 MHz IF bandwidth (refer device data sheet)

	Real/Pseudo Real	Complex1x	Complex2x
Regular ADC mode	37.5 Msps	18.75 Msps	37.5 Msps
Low power ADC mode	18.75 Msps	9.375 Msps	18.75 Msps

When device supports 10 MHz IF bandwidth (refer device data sheet)

	Real/Pseudo Real	Complex1x	Complex2x
Regular ADC mode	25 Msps	12.5 Msps	25 Msps
Low power ADC mode	18.75 Msps	9.375 Msps	18.75 Msps

When device supports 5 MHz IF bandwidth (refer device data sheet)

	Real/Pseudo Real	Complex1x	Complex2x
Regular ADC mode	12.5 Msps	6.25 Msps	12.5 Msps
Low power ADC mode	12.5 Msps	6.25 Msps	12.5 Msps

- The IF bandwidth here refers to the IF frequency of the farthest reflection desired to be detected
- Typically, the IF frequency range preserved well in the receiver baseband is $0.9 \times$ Sampling Rate in Complex 1x and $0.45 \times$ Sampling Rate in Complex 2x and Real/Pseudo Real.
- The maximum sampling rates are also subject to restrictions from LVDS/CSI2 interface rate and ADC bits configurations. Typically in Complex2x mode, the maximum sampling rate would be 25 Msps

5.5.2 Sub block 0x0101 – AWR_CHIRP_CONF_SET_SB

This sub block contains chirp to chirp variations on top of the chirp profiles defined in the AWR_PROFILE_CONF_SET_SB. E.g. which profile is to be used for each chirp in a frame, and small dithers in FMCW start frequency and idle time for each chirp are possible to be defined here. The dithers used in this configuration sub block are only additive on top of programmed parameters in AWR_PROFILE_CONF_SET_SB.

Table 5.25 describes the contents of this sub block.

Table 5.25: AWR_CHIRP_CONF_SET_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0101
SBLKLEN	2	Value = 24

5.5.3 Sub block 0x0102 – AWR_FRAME_CONF_SET_SB

This sub block defines a frame, i.e. a sequence of chirps to be transmitted subsequently, the no. of frames to be transmitted, frame periodicity and how to trigger them.

Table 5.26 describes the contents of this sub block.

Table 5.26: AWR_FRAME_CONF_SET_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0102
SBLKLEN	2	Value = 28
RESERVED	2	May use to indicate Frame mode or Continuous chirping mode of operation.
CHIRP_START_INDXX	2	Valid range 0 to 511 NOTE: If ADVANCE_CHIRP_CONFIG_EN is set then this Field is not used/applicable.
CHIRP_END_INDXX	2	Valid range CHIRP_START_INDXX to 511 NOTE: If ADVANCE_CHIRP_CONFIG_EN is set then this Field is not used/applicable.

Table 5.26 – continued from previous page

NUM_LOOPS	2	<p>Number of times to repeat from CHIRP_START_INDX to CHIRP_END_INDX in each frame Valid range 1 to 255</p> <p>NOTE: If ADVANCE_CHIRP_CONFIG_EN is set then this Field definition is modified.</p> <p>ADVANCE_CHIRP_CONFIG mode: This field configures the total number of chirps in a frame L. This should be programmed as per below calculation. L = X * Y, where X is 1 to 512 (HW RAM) and Y is 1 to 128 (HW loops) The value of L should be a multiple of 4 (assuming each chirp is min 25us duration) i.e 1, 4, 8, 12, 16, 20, ... 32768 (max). The FW needs to prepare and update HW chirp RAM dynamically in advance chirp config API, this puts some restriction on minimum number of chirps in a burst/frame. Valid range 1 to 32768</p>
NUM_FRAMES	2	<p>Number of frames to transmit 16 bit unsigned number Valid range: 0 to 65535 (0 for infinite frames)</p>
RESERVED	2	0x0000
FRAME_PERIODICITY	4	<p>$PERIOD \geq \text{Sum total time of all chirps} + \text{InterFrameBlankTime}$, where, $\text{Sum total time of all chirps} = \text{Num Loops} * \text{Num chirps} * \text{Chirp Period}$. <i>InterFrameBlankTime</i> is primarily for sensor calibration/monitoring, thermal control, transferring out any safety monitoring data if requested, hardware reconfiguration for next frame, re triggering of next frame. $\text{InterFrameBlankTime} \geq 300 \mu\text{s}$ typical, refer a NOTE end of this API for more info. Add $150 \mu\text{s}$ to <i>InterFrameBlankTime</i> if data-path reconfiguration needed in frame boundary due to change in profile. 1 LSB = 5 ns Valid range $300 \mu\text{s}$ to 1.342 s</p>

Continued on next page

Table 5.26 – continued from previous page

		Value	Definition
TRIGGER_SELECT	2	0x0001	SWTRIGGER (Software API based triggering): Frame is triggered upon receiving AWR_FRAMESTARTSTOP_CONF_SB. There could be several tens of micro seconds uncertainty in triggering. This mode is not applicable if this device is configured as MULTICHIP_SLAVE in AWR_CHAN_CONF_SB.
		0x0002	HWTRIGGER (Hardware SYNC_IN based triggering): Each frame is triggered by rising edge of pulse in SYNC_IN pin, after receiving AWR_FRAMESTARTSTOP_CONF_SB (this is to prevent spurious transmission). W.r.t. the SYNC_IN pulse, the actual transmission has 160ns delay and 5ns uncertainty in SINGLECHIP and only a 300 ps uncertainty (due to tight inter-chip synchronization needed) in MULTICHIP sensor applications as defined in AWR_CHAN_CONF_SB. For more details please refer to device datasheet.
RESERVED	1	0x00	
RESERVED	1	0x00	
FRAME_TRIGGER_DELAY	4		Optional time delay from the SYNC_IN trigger to the occurrence of frame chirps. Applicable only in SINGLECHIP sensor applications, as defined in AWR_CHAN_CONF_SB. It is recommended only for staggering the transmission of multiple radar sensors around the car for interference avoidance, if needed. Typical range is 0 to 100 micro seconds. Units: 1 LSB = 5 ns

NOTE1:	If hardware triggered mode is used, the SYNC_IN pulse width should be less than the ON time of the frame (in case of legacy frame config mode) or the ON time of the burst (in case of advanced frame config mode). Also, the minimum pulse width of SYNC_IN should be 25 ns.
NOTE2:	If frame trigger delay is used with hardware triggered mode, then external SYNC_IN pulse periodicity should take care of the configured frame trigger delay and frame periodicity. The external pulse should be issued only after the sum total of frame trigger delay and frame periodicity. See figure below
NOTE3:	If dummy chirp is used then programmer should make sure the idle time of dummy chirp $\geq 4\mu\text{s} + \text{DFE spill over time of previous chirp}$ (calculate from rampgen calculator). The first chirp of frame can not be a dummy chirp.
NOTE4:	In Hw triggered mode, the Hw pulse should be issued or periodicity of pulse is configured such that, the pulse is generated only 150us after the completion of previous frame/burst (The pulse should not be issued before end of previous frame/burst). The time delta between end of previous frame/burst and raising edge of Hw pulse recommended to be $< 300\mu\text{s}$.
NOTE5:	The PF_NUM_ADC_SAMPLES parameter should be identical across chirps in a frame, when multiple profiles are used in a frame.
NOTE6:	The PF_DIGITAL_OUTPUT_SAMPLING_RATE impacts the LVD-S/CSI2 data rate in a frame, so it is recommended to analyze timing impact if different sample rate is used across chirps in a frame.
NOTE7:	Please refer Table 11.3 for details on minimum inter-frame blank time requirements.
NOTE8:	If advance chirp configuration is enabled then this API takes around 1.8ms to execute in RadarSS sub System for 128 chirps. The error checks for each parameters of advance chirp is done in frame configuration API.

Figure 5.1: Frame trigger delay in case of external hardware trigger

5.5.4 Sub block 0x0103 – AWR_CONT_STREAMING_MODE_CONF_SET_SB

This sub block contains configuration needed to enable continuous streaming mode from the device.

NOTE: The continuous streaming mode configuration APIs are supported only for debug purpose. Please refer latest DFP release note for more info.

Table 5.27 describes the contents of this sub block.

Table 5.27: AWR_CONT_STREAMING_MODE_CONF_SET_SB contents

Field Name	Number of bytes	Description

The FW needs to prepare and update HW chirp RAM dynamically in advance chirp config API, this puts some restriction on minimum number of chirps in a burst/frame. Valid range 1 to 32768</p>
SF3_BURST_PERIOD	4	<p>$BURST_PERIOD \geq (NUM_LOOPS_PER_BURST) * (\text{Sum total of all unique chirp times per burst}) + InterBurstBlankTime$, where <i>InterBurstBlankTime</i> is primarily for sensor calibration / monitoring, thermal control, and some minimum time needed for triggering next burst. InterBurstBlankTime $\geq 110 \mu s$ typical, refer a NOTE end of this API for more info.</p> <p>NOTE: Across bursts, if the value (Sum total of all unique chirp times per burst), is not a constant, then the actual available blank time can vary and needs to be accounted for. 1 LSB = 5 ns Valid range: 55 μs to 1.342 s</p>
SF3_CHIRP_START_INDX_OFFSET	2	<p>The chirp start index for each burst is determined as the chirp start index of the previous burst plus SFx_START_INDX_OFFSET * BURST_INDX i.e. $CHIRP_START_INDX = SFx_CHIRP_START_INDX + (SFx_CHIRP_START_INDX_OFFSET \times BURST_INDEX)$ Valid range: 0 to 511</p> <p>A value of 0 can be used to repeat the same set of unique chirps across bursts. Non-zero values allow spanning a larger number of unique chirps (across bursts). This field Not applicable for loop-back sub-frame</p> <p>NOTE: If ADVANCE_CHIRP_CONFIG_EN is set then this Field is not used/applicable.</p>
SF3_NUM_BURSTS	2	<p>Number of bursts constituting this sub frame Valid range: 1 to 512 Valid range: 1 to 16 for loop-back sub-frame</p>

Continued on next page

Table 5.29 – continued from previous page

SF3_NUM_OUTER_LOOPS	2	Number of times to loop over the set of above defined bursts, for this sub frame. Valid range: 1 to 64 This field is Not applicable for loop-back sub-frame
RESERVED	2	0x0000
SF3_PERIOD	4	$PERIOD \geq \text{Sum total time of all bursts} + \text{InterSubFrameBlankTime}$, Where, Sum total time of all bursts = Num Outer Loops * Num Bursts * Burst Period. <i>InterSubFrameBlankTime</i> is primarily for sensor calibration / monitoring, thermal control, transferring out any safety monitoring data if requested, hardware reconfiguration for next sub frame, retriggering of next SF. $\text{InterSubFrameBlankTime} \geq 300 \mu\text{s}$ typical, refer a NOTE end of this API for more info. Add $150 \mu\text{s}$ to <i>InterSubFrameBlankTime</i> if data-path re-configuration needed in sub-frame boundary due to change in profile. 1 LSB = 5 ns Valid range: $300 \mu\text{s}$ to 1.342 s
RESERVED	4	0x00000000
RESERVED	4	0x00000000
SF4_PROFILE_INDX	2	This is applicable only if FORCE_SINGLE_PROFILE is set to 1. Please refer to that field for description. Valid range: 0 to 3
SF4_CHIRP_START_INDX	2	Start index of the first chirp in this sub frame Valid range: 0 to 511 This field Not applicable for loop-back sub-frame NOTE: If ADVANCE_CHIRP_CONFIG_EN is set then this Field is not used/applicable.
SF4_NUM_UNIQUE_CHIRPS_PER_BURST	2	Number of unique chirps per burst Valid range: 1 to 512 This field Not applicable for loop-back sub-frame NOTE: If ADVANCE_CHIRP_CONFIG_EN is set then this Field is not used/applicable.

Table 5.29 – continued from previous page

SF4_NUM_LOOPS_PER_BURST	2	<p>Number of times to loop through the unique chirps in each burst, without gaps, using HW. Valid range: 1 to 255</p> <p>NOTE: If ADVANCE_CHIRP_CONFIG_EN is set then this Field definition is modified.</p> <p>ADVANCE_CHIRP_CONFIG mode: This field configures the total number of chirps in a burst L. This should be programmed as per below calculation. L = X * Y, where X is 1 to 512 (HW RAM) and Y is 1 to 128 (HW loops) The value of L should be a multiple of 4 (assuming each chirp is min 25us duration) i.e 1, 4, 8, 12, 16, 20, ... 32768 (max). The FW needs to prepare and update HW chirp RAM dynamically in advance chirp config API, this puts some restriction on minimum number of chirps in a burst/frame. Valid range 1 to 32768</p>
SF4_BURST_PERIOD	4	<p>$BURST_PERIOD \geq (NUM_LOOPS_PER_BURST) * (\text{Sum total of all unique chirp times per burst}) + InterBurstBlankTime$, where <i>InterBurstBlankTime</i> is primarily for sensor calibration / monitoring, thermal control, and some minimum time needed for triggering next burst. InterBurstBlankTime $\geq 110 \mu s$ typical, refer a NOTE end of this API for more info.</p> <p>NOTE: Across bursts, if the value (Sum total of all unique chirp times per burst), is not a constant, then the actual available blank time can vary and needs to be accounted for.</p> <p>1 LSB = 5 ns Valid range: 55 μs to 1.342 s</p>
SF4_CHIRP_START_INDX_OFFSET	2	<p>The chirp start index for each burst is determined as the chirp start index of the previous burst plus SFx_START_INDX_OFFSET * BURST_INDX i.e. $CHIRP_START_INDX = SFx_CHIRP_START_INDX + (SFx_CHIRP_START_INDX_OFFSET \times BURST_INDEX)$ Valid range: 0 to 511</p> <p>A value of 0 can be used to repeat the same set of unique chirps across bursts. Non-zero values allow spanning a larger number of unique chirps (across bursts). This field Not applicable for loop-back sub-frame</p> <p>NOTE: If ADVANCE_CHIRP_CONFIG_EN is set then this Field is not used/applicable.</p>
SF4_NUM_BURSTS	2	<p>Number of bursts constituting this sub frame Valid range: 1 to 512 Valid range: 1 to 16 for loop-back sub-frame</p>

Continued on next page

Table 5.29 – continued from previous page

SF4_NUM_OUTER_LOOPS	2	Number of times to loop over the set of above defined bursts, for this sub frame. Valid range: 1 to 64 This field is Not applicable for loop-back sub-frame
RESERVED	2	0x0000
SF4_PERIOD	4	$SF_PERIOD \geq \text{Sum total time of all bursts} + \text{InterSubFrameBlankTime}$, where, Sum total time of all bursts = Num Outer Loops * Num Bursts * Burst Period. <i>InterSubFrameBlankTime</i> is primarily for sensor calibration / monitoring, thermal control, transferring out any safety monitoring data if requested, hardware reconfiguration for next sub frame, retriggering of next SF. $\text{InterSubFrameBlankTime} \geq 300 \mu\text{s}$ typical, refer a NOTE end of this API for more info. Add 150 μs to <i>InterSubFrameBlankTime</i> if data-path re-configuration needed in sub-frame boundary due to change in profile. 1 LSB = 5 ns Valid range: 300 μs to 1.342 s
RESERVED	4	0x00000000
RESERVED	4	0x00000000
NUM_FRAMES	2	Number of frames to transmit (1 frame = all enabled sub frames). If set to 0, frames are transmitted endlessly till Frame Stop message is received. Valid range: 0 to 65535
TRIGGER_SELECT	2	0x0001 SWTRIGGER (Software API based triggering): Frame is triggered upon receiving AWR_FRAMESTARTSTOP_CONF_SB. There could be several tens of micro seconds uncertainty in triggering. This mode is not applicable if this device is configured as MULTICHIP_SLAVE in AWR_CHAN_CONF_SB. 0x0002 HWTRIGGER (Hardware SYNC_IN based triggering): Each frame is triggered by rising edge of pulse in SYNC_IN pin, after receiving AWR_FRAMESTARTSTOP_CONF_SB (this is to prevent spurious transmission). w.r.t. the SYNC_IN pulse, the actual transmission has 5ns uncertainty in SINGLECHIP and only a 300 ps uncertainty (due to tight inter-chip synchronization needed) in MULTICHIP sensor applications as defined in AWR_CHAN_CONF_SB.

Continued on next page

Table 5.29 – continued from previous page

FRAME_TRIG- GER_DELAY	4	Optional time delay from the SYNC_IN trigger to the occurrence of frame chirps. Applicable only in SINGLECHIP sensor applications, as defined in AWR_CHAN_CONF_SB. It is recommended only for staggering the transmission of multiple radar sensors around the car for interference avoidance, if needed. Typical range is 0 to few tens of micro seconds. Units: 1 LSB = 5 ns
RESERVED	4	0x00000000
RESERVED	4	0x00000000

NOTE1:	If hardware trigger mode is used with SUBFRAMETRIGGER = 0, then the trigger should be issued for each burst. If SUBFRAMETRIGGER = 1, then the trigger needs to be issued for each sub-frame.
NOTE2:	If hardware triggered mode is used, the SYNC_IN pulse width should be less than the ON time of the frame (in case of legacy frame config mode) or the ON time of the burst (in case of advanced frame config mode). Also, the minimum pulse width of SYNC_IN should be 25 ns.
NOTE3:	If frame trigger delay is used with hardware triggered mode, then external SYNC_IN pulse periodicity should take care of the configured frame trigger delay and frame periodicity. The external pulse should be issued only after the sum total of frame trigger delay and frame periodicity. See figure below
NOTE4:	In Hw triggered mode, the Hw pulse should be issued or periodicity of pulse is configured such that, the pulse is generated only 150us after the completion of previous frame/burst (The pulse should not be issued before end of previous frame/burst). The time delta between end of previous frame/burst and raising edge of Hw pulse recommended to be < 300us.
NOTE5:	The PF_NUM_ADC_SAMPLES parameter should be identical across chirps in a sub-frame, when multiple profiles are used in a sub-frame.
NOTE6:	The PF_DIGITAL_OUTPUT_SAMPLING_RATE impacts the LVD-S/CSI2 data rate in a sub-frame, so it is recommended to analyze timing impact if different sample rate is used across chirps in a sub-frame.
NOTE7:	Please refer Table 11.2 and Table 11.3 for details on minimum inter-burst and inter sub-frame/frame blank time requirements.
NOTE8:	If advance chirp configuration is enabled then this API takes around 1.8ms to execute in RadarSS sub System for 128 chirps. The error checks for each parameters of advance chirp is done in frame configuration API.

Figure 5.2: Frame trigger delay in case of external hardware trigger

5.5.7 Sub block 0x0106 – AWR_PERCHIRPPHASESHIFT_CONF_SB

This sub block defines static phase shift configurations per chirp in each of the TXs. The API is applicable only in certain devices (Please refer data sheet). This API will be honored after enabling PERCHIRP_PHASESHIFTER_EN in AWR_RF_RADAR_MISC_CTL_SB.

Table 5.30 describes the contents of this sub block.

Table 5.30: AWR_PERCHIRPPHASESHIFT_CONF_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0106
SBLKLEN	2	Value = 12
CHIRP_START_INDXX	2	Start index of the chirp for configuring the phase shifter Valid range 0 to 511
CHIRP_END_INDXX	2	End index of the chirp for configuring the phase shifter Valid range 0 to 511
TX0_PHASE_SHIFTER	1	TX0 phase shift value Bits TX0 phase shift definition b1:0 RESERVED (set it to 0b00) b7:2 TX0 phase shift value 1 LSB = $360^\circ/2^6 = 5.625^\circ$ Valid range: 0 to 63

Continued on next page

Table 5.30 – continued from previous page

TX1_PHASE_SHIFTER	1	TX1 phase shift value Bits TX1 phase shift definition b1:0 RESERVED (set it to 0b00) b7:2 TX1 phase shift value 1 LSB = $360^\circ/2^6 = 5.625^\circ$ Valid range: 0 to 63
TX2_PHASE_SHIFTER	1	TX2 phase shift value Bits TX2 phase shift definition b1:0 RESERVED (set it to 0b00) b7:2 TX2 phase shift value 1 LSB = $360^\circ/2^6 = 5.625^\circ$ Valid range: 0 to 63
RESERVED	1	0x00

NOTE1: Phase shifters are applied in advance at -5us or at -(idle time-1.5us) from knee of the ramp whichever is small.

5.5.8 Sub block 0x0107 – AWR_PROG_FILTER_COEFF_RAM_SET_SB

This sub block can be used to program the coefficients for the external programmable filter. This is a new feature added in **AWR2243**.

The programmable filter allow for a trade-off between digital filter chain settling time and close-in anti-alias attenuation. The Maximum DFE outout sampling rate in real mode is 25Msps and in complex mode is 22.5Msps.

A real-coefficient FIR with up to 63 taps (16-bit coefficients) is supported in both Complex and real output mode.

Table 5.31: Programmable filter DFE sampling rate and number of taps

DFE sampling rate Fs (Msps)	Number of taps in Real Mode	Number of taps in Complex Mode
>=25	42	NA
>=12.5, <25	42	21
>=6.25, <12.5	63	45
else	63	63

NOTE: This API should be issued before AWR_PROFILE_CONF_SET_SB.

Table 5.32 describes the contents of this sub block.

Table 5.32: AWR_PROG_FILT_COEFF_RAM_SET_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0107
SBLKLEN	2	Value = 212
COEFF_ARRAY	208	<p>The array of coefficients for the programmable filter, across all profiles, to be stored in the coefficient RAMS. Each tap is a 16-bit signed <1.15, s> number. The exact set of taps to be used for a given profile can be specified through AWR_PROG_FILT_CONF_SB</p> <p>NOTE: All the filter taps across profiles are to be provided in one shot. There is a HW constraint that each profile's filter taps should start at four 32-bit word aligned address (i.e., the coefficients corresponding to any profile should start at array index which is a multiple of 8). Unused coefficients shall be initialized to zero.</p>

5.5.9 Sub block 0x0108 – AWR_PROG_FILT_CONF_SET_SB

This sub block can be used to configure the coefficients for the external programmable filter and associate them to a certain profile. The API is applicable only in xWR1642/IWR6843/xWR1843/AWR2243. This API should be issued before AWR_PROFILE_CONF_SET_SB. Table 5.33 describes the contents of this sub block.

Table 5.33: AWR_PROG_FILT_CONF_SET_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0108
SBLKLEN	2	Value = 8
PROFILE_INDX	1	This field indicates the profile Index for which this configuration applies.
PROG_FILT_COEFF_START_INDEX	1	<p>The index of the first coefficient of the programmable filter taps corresponding to this profile in the coefficient RAM programmed using AWR_PROG_FILT_COEFF_SET_SB</p> <p>NOTE: The profile's filter tap start index shall be 8 tap aligned (four 32-bit word aligned address).</p>

Continued on next page

Table 5.33 – continued from previous page

PROG_FILT_LENGTH	1	The length (number of taps) of the filter corresponding to this profile. Together with the previous field, this determines the set of coefficients picked up from the coefficient RAM to form the filter taps for this profile. NOTE: This has to be an even number. For odd-length filters, a 0 (zero) tap needs to be appended at the end to make the length even. This is a HW constraint.
PROG_FILT_FREQ_SHIFT_FACTOR	1	Relevant only for the Complex output mode with the programmable filter. Determines the magnitude of the frequency shift to be done before filtering using the real-coefficient programmable filter. 1 LSB = $0.01 \times F_s$ shift, where F_s is the output sampling rate, specified as PF_DIGITAL_OUTPUT_SAMPLING_RATE in AWR_PROFILE_CONF_SET_SB

NOTE1:	PROG_FILT_COEFF_START_INDEX should be 8 tap aligned (four 32-bit word aligned address)
NOTE2:	Programmable filter APIs (AWR_PROG_FILT_COEFF_RAM_SET_SB and AWR_PROG_FILT_CONF_SET_SB) should not be issued when frames are ongoing.

5.5.10 Sub block 0x0109 – AWR_CALIB_MON_TIME_UNIT_CONF_SB

This API sub block is used to set calibration and monitoring time unit.

Table 5.34: AWR_CALIB_MON_TIME_UNIT_CONF_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0109
SBLKLEN	2	Value = 12

Continued on next page

Table 5.34 – continued from previous page

CALIB_MON_TIME_UNIT	2	<p>Defines the basic time unit, in terms of which calibration and/or monitoring periodicities are to be defined.</p> <p>If any monitoring functions are desired and enabled, the monitoring infrastructure automatically inherits this time unit as the period over which the various monitors are cyclically executed; so this should be set to the desired FTTI.</p> <p>For calibrations, a separate CALIB_PERIODICITY can be specified, as a multiple of this time unit, in AWR_RUN_TIME_CALIBRATION_CONF_AND_TRIGGER_SB</p> <p>NOTE: Even though calibrations many not be desired every time unit, every time unit shall be made long enough to include active chirping time, time required for all enabled calibrations and monitoring functions.</p> <p>1 LSB = Duration of one frame Recommendation: See examples in Section 12 Default value in Device: 100 Valid range : 40ms to 250ms (Derive actual count value from programmed frame period)</p>
NUM_OF_CASCADED_DEV	1	<p>The num of cascaded AWR2243 devices in a system if MONITORING_MODE is 0. In non-cascaded mode set this to 1.</p> <p>If MONITORING_MODE is 1 (API based trigger), then even in cascade mode this value can be 1 (Host controls the sequence of monitoring triggers). This control helps the device to schedule autonomous monitors in round robin fashion to avoid inter device interference.</p> <p>Default value: 1</p>
DEVICE_ID	1	<p>Applicable only in cascaded mode, Typically Master device is set to 0 and slave devices are set to 1, 2, and 3 respectively in 4 chip cascade system if MONITORING_MODE = 0 . In non-cascaded mode and if MONITORING_MODE = 1 then set this to 0</p> <p>Default value: 0</p>
MONITORING_MODE	1	<p>Mostly applicable for cascade devices to control execution of monitoring types, refer AWR_MONITOR_TYPE_TRIG_CONF_SB for more details .</p> <p>0 Autonomous monitoring trigger (default)</p> <p>1 API based monitoring trigger</p> <p>Note: This feature is supported only on AWR2243 device.</p>
RESERVED	3	0x00_0000

NOTE: The Minimum total blank time in a CAL_MON_TIME_UNIT shall be 1ms to run internal APLL and SYNTH calibrations + ~12.5% of CAL_MON_TIME_UNIT for WDT clearing time if WDT is enabled. Refer to Table 12.3, Table 12.4 for the duration of run time monitors and Table 12.5 for software overheads.

5.5.11 Sub block 0x010A – AWR_RUN_TIME_CALIBRATION_CONF_AND_TRIGGER_SB

This API is used to trigger one time calibrations instantaneously or schedule periodic run time calibrations, which will be scheduled while framing in inter-burst idle time (Min available idle time of 250 μ s is required).

Table 5.35: AWR_RUN_TIME_CALIBRATION_CONF_AND_TRIGGER_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x010A
SBLKLEN	2	Value = 24

NOTE1: The API AWR_RUN_TIME_CALIBRATION_CONF_AND_TRIGGER_SB can be issued when the device is framing, the calibration periodicity update or one time calibrations can be done while frames are running.

NOTE2: The CAL_TEMP_INDEX_OVERRIDE_ENABLE is supported only for one time calibrations enabled using ONE_TIME_CALIB_ENABLE_MASK, the periodic run time calibrations are recommended to be disabled using PERIODIC_CALIB_ENABLE_MASK.

5.5.12 Sub block 0x010B – AWR_DIGITAL_COMP_EST_CONTROL_SB

This API can be used to compensate various RX and gain/phase offsets and same API can be used to estimation the same using TX frequency shift.

- NOTE1:** This API is supported only on AWR2243 device. Please refer latest DFP release note for more info.
- NOTE2:** Issue this API first in the sequence before AWR_PROFILE_CONF_SET_SB API.
- NOTE3:** The Digital TX frequency shift enable mode in below API is for debug purpose only, the functional phase shifter will not be operational when this mode is used. It is recommended to re-issue profile config API after disabling this mode before running functional frames.

5.5.15 Sub block 0x010E – AWR_LOOPBACK_BURST_CONF_SET_SB

This API can be used to introduce loopback chirps within the functional frames. This loopback chirps will be introduced only if advanced frame configuration is used where user can define which sub-frame contains loopback chirps. The following loopback configuration will apply to one burst and user can program up to 16 different loopback configurations in 16 different bursts of a given sub-frame. User has to ensure that the corresponding sub-frame is defined in AWR_ADVANCED_FRAME_CONF_SB and sufficient time is given to allow the loopback bursts to be transmitted.

NOTE1:	If user desires to enable loopback chirps within functional frames, then this API should be issued after AWR_PROFILE_CONF_SET_SB
NOTE2:	Only profile based phase shifter is supported in loopback configuration. Per-chirp phase shifter if enabled will not be reflected in loopback chirps.
NOTE3:	For the sub-frame in which loopback is desired, user should set SFx_NUM_UNIQUE_CHIRPS_PER_BURST as 1 and can use SFx_NUM_LOOPS_PER_BURST for multiple chirps in the burst.

Table 5.39: AWR_LOOPBACK_BURST_CONF_SET_SB contents

5.5.20 Sub block 0x0113 – AWR_SUBFRAME_START_CONF_SB

This API can be used to trigger each sub-frame individually in software triggered mode. This API takes effect only when the advanced frame configuration indicates that each sub-frame needs to be individually triggered by the user.

Table 5.44: AWR_SUBFRAME_START_CONF_SB contents

Field Name	Number of bytes	Description								
SBLKID	2	Value = 0x0113								
SBLKLEN	2	Value = 8								
START_CMD	2	<table border="1"> <thead> <tr> <th>Bits</th> <th>Definition</th> </tr> </thead> <tbody> <tr> <td>b15:0</td> <td>Value Definition</td> </tr> <tr> <td>0x0000</td> <td>No effect</td> </tr> <tr> <td>0x0001</td> <td>Trigger next sub-frame in software triggered sub-frame mode</td> </tr> </tbody> </table>	Bits	Definition	b15:0	Value Definition	0x0000	No effect	0x0001	Trigger next sub-frame in software triggered sub-frame mode
Bits	Definition									
b15:0	Value Definition									
0x0000	No effect									
0x0001	Trigger next sub-frame in software triggered sub-frame mode									
RESERVED	2	0x0000								

NOTE1:	If the user wishes to trigger each sub-frame independently, then after advanced frame config, the FRAME START command should be issued once using AWR_FRAMESTARTSTOP_CONF_SB. This does not start any sub-frames but it will prepare the hardware for sub-frame trigger. Next any subsequent sub-frame trigger will start the sub-frames
NOTE2:	If the user wishes to use sub-frame trigger, he has to ensure that sub-frame trigger command is issued $k \cdot N$ times where k is the number of sub-frames in each frame and N is the number of frames. If the user wishes to stop frames in between, then he has to issue the FRAME STOP command (using AWR_FRAMESTARTSTOP_CONF_SB) only after $k \cdot M$ triggers of sub-frame trigger command (where M is an integer). i.e. FRAME STOP command can be issued only at frame boundaries
NOTE3:	If software based sub-frame trigger mode is chosen by the user, watchdog feature will not be available. User has to ensure that the watchdog is disabled before enabling the software based sub-frame trigger mode.
NOTE4:	If sub-frame trigger or hardware trigger mode is used to trigger the frames/sub-frames and if frames need to be stopped before the specified number of frames, then the the FRAME_STOP command using AWR_FRAMESTARTSTOP_CONF_SB API should be issued while the frame is on-going. If the frames are stopped while the device is idle, it can lead to errors.

5.5.21 Sub block 0x0115 – AWR_ADVANCE_CHIRP_CONF_SB

This API sub-block defines the programming of advanced chirp configurations for each chirp parameters to generate a waveform pattern in a frame/burst. This API provides ability to program fixed delta increment (Delta dither) for certain chirp parameters (eg. chirp start frequency, idle time, phase shifter, etc.), on top of unique dithers selected from configurable look-up-table (LUT Dither). The configurable look-up-table is an array of values loaded into a pre-configured “Generic SW Chirp Parameter LUT” The size of the generic LUT is 12kB and user has the flexibility to program any number of unique dithers for each chirp parameters. Thus the user can achieve fixed increment, or LUT based dither, or a combination of both.

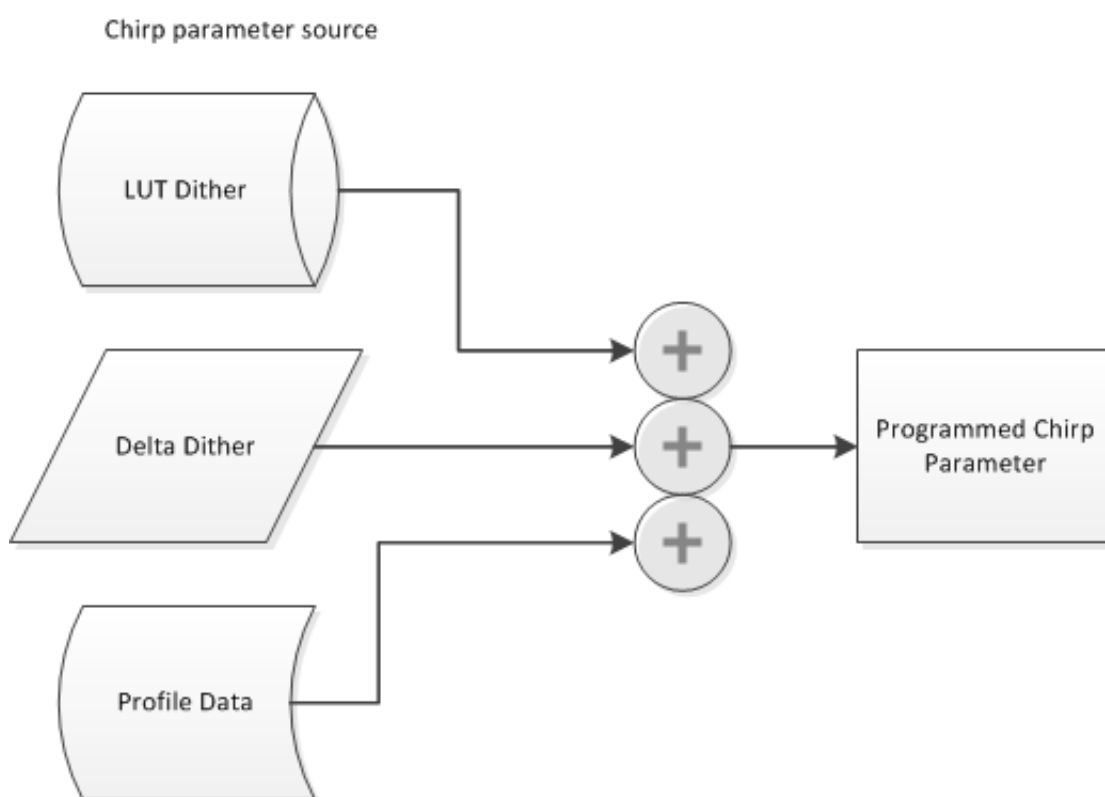

Figure 5.4: Advance chirp parameter dither sources and program

Using this API, four types of control can be achieved on each parameters of a chirp.

1. Fixed value for all chirps: To generate sequence of chirps which never changes, then only

- one value can be programmed in LUT (LUT Dither), i.e NUM_OF_PATTERNS (P) = 1 and LUT_PARAM_UPDATE_PERIOD (K) = 0
2. Unique chirps: Index every LUT_PARAM_UPDATE_PERIOD (K) chirps in LUT to generate unique sequence of chirps.
 3. Delta increment every DELTA_PARAM_UPDATE_PERIOD (N) chirps: On top of sequence of unique chirps from LUT, the fixed delta increment (Delta dither) can be done every N chirps.
 4. The set of chirp parameters across bursts and sub-frames can be different by setting offset to LUT in BURST_LUT_INDEX_OFFSET and SF_LUT_INDEX_OFFSET.

When using the Advanced Chirp Config API, there are some implications to frame config and advanced frame config APIs. Specifically, the CHIRP_START_INDX and CHIRP_END_INDX fields are no longer applicable, and the NUM_LOOPS field has a different meaning in the sense that this field now denotes the total number of chirps in the frame/burst. Please refer [AWR_FRAME_CONF_SET_SB](#) and [AWR_ADVANCED_FRAME_CONF_SB](#) APIs with the updated field descriptions as below.

The total number of chirps L in a burst should be programmed as per below calculation in frame configuration API (using the NUM_LOOPS field).

$L = X * Y$, where X is 1 to 512 (supported HW CHIRP RAM) and Y is 1 to 128 (supported HW CHIRP LOOPS) The value of L should be a multiple of 4 (assuming each chirp is min 25us duration) i.e 1, 4, 8, 12, 16, 20, ... 32768 (max). The FW needs to prepare and update HW CHIRP RAM dynamically in advance chirp config API, this puts some restriction on minimum number of chirps in a burst/frame.

NOTE1:	The Legacy AWR_CHIRP_CONF_SET_SB , AWR_DYN_CHIRP_CONF_SET_SB , AWR_PERCHIRPPHASESHIFT_CONF_SB , AWR_DYN_PERCHIRP_PHASESHIFTER_CONF_SET_SB and AWR_BPM_CHIRP_CONF_SET_SB APIs are not supported if device is configured with Advanced Chirp Config API enabled in AWR_RF_RADAR_MISC_CTL_SB or vice versa.
NOTE2:	The per chirp phase shifter and BPM configurations are part of this API.
NOTE3:	The parameters in this API are not applicable to loop-back sub-frames AWR_LOOPBACK_BURST_CONF_SET_SB . If loop-back sub-frames are needed, it is recommended to be configured in the last sub-frame (SF) of AWR_ADVANCED_FRAME_CONF_SB API.
NOTE4:	The dynamic update of this API is allowed at frame boundary along with the Generic SW Chirp Parameters, as long as the LUT addresses modified differ from the addresses used in the current ongoing frame. The dynamic chirp enable API AWR_DYN_CHIRP_ENABLE_SB shall be issued at least 500us before end of current active window of frame (500us before start of idle time of the frame) to apply the dynamic configurations in immediate next frame.
NOTE5:	The RF frequency used for measurement in monitors are derived only from profile settings (start frequency and slope) and not from the advance chirp configuration API, if fixed delta increment is used to change the start frequency every chirp, it is recommended to have a separate profile for monitors which covers full RF bandwidth of interest.

Table 5.45 describes the contents of this sub block. All the fields in this API are specific to selected CHIRP_PARAM_INDEX in this API, this API needs to be programmed ten times for each of the chirp parameters defined in CHIRP_PARAM_INDEX field in below API.

The Delta Dither is optional and can be disabled by setting DELTA_PARAM_UPDATE_PERIOD (N) = 0 and SF_n_CHIRP_PARAM_DELTA = 0.

The LUT Dither is mandatory and at least one dither parameter value (it can be value zero) shall be programmed for all chirp parameters in generic LUT, same dither value can be programmed to all chirps in a burst/frame by setting LUT_PARAM_UPDATE_PERIOD (K) = 0.

LUT_PATTERN_ADDRESS_OFFSET	2	<p>This field provides the start address offset within the Generic SW Chirp Parameter LUT which holds dither parameters (LUT Dither) for this CHIRP_PARAM_INDEX.</p> <p>The first chirp of the burst/frame picks the dither from 0th index to LUT with this address offset and dithers for next chirps will be derived based on pattern configuration defined in this API.</p> <p>Address offset has to be multiple 4 bytes (word boundary) The Generic SW chirp parameters are described in Table 5.48 and it can be loaded in to LUT using AWR_ADVANCE_CHIRP_GENERIC_LUT_LOAD_SB API.</p>
NUM_OF_PATTERNS (P)	2	<p>This field provides the number of unique dither parameters present in LUT (LUT Dither).</p> <p>Valid range: 1 to 8192 0 is not a valid number</p> <p>This information is used to perform array out of bound error check on index to LUT in FW.</p>
BURST_LUT_INDEX_OFFSET	2	<p>Only relevant when using Advanced Frame Config API. Provides flexibility to have an offset in index to LUT (LUT Dither) from one burst to the next burst. This field provides the LUT index start offset for subsequent bursts in advanced frame config API. The chirp LUT start index for each burst is determined as the chirp LUT start index of the previous burst plus BURST_LUT_INDEX_OFFSET. This feature helps to loop set of different chirps in subsequent bursts in a sub-frame.</p> <p>Valid Range: 0 to P 0 – No offset (default) 1 to P – LUT index start offset for each burst.</p> <p>NOTE1: The first burst in second or higher sub-frame is always indexing to SF_LUT_INDEX_OFFSET parameter in LUT.</p> <p>NOTE2: The LUT_RESET_PERIOD can not be more than number of chirps in a burst if this feature is used.</p>

Table 5.45 – continued from previous page

SF_LUT_INDEX_OFFSET	2	<p>Only relevant when using Advanced Frame Config API. Provides flexibility to have an offset in index to LUT (LUT Dither) from one subframe to the next subframe. This field provides the LUT index start offset for subsequent sub-frames in advanced frame config. The chirp LUT start index for first burst in each SF is determined as the chirp LUT start index of the previous SF plus SF_LUT_INDEX_OFFSET. This feature helps to loop set of different chirps in subsequent sub-frames.</p> <p>Valid Range: 0 to P 0 – No offset (default) 1 to P - LUT index start offset for each sub-frame (SF).</p> <p>NOTE1: The first SF in advance frame is always indexing to 0th parameter in LUT. NOTE2: The LUT_RESET_PERIOD can not be more than number of chirps in a sub-frame if this feature is used.</p>																				
LUT_CHIRP_PARAM_SIZE	1	<p>This field is applicable only for LUT chirp parameters (LUT Dither) of type CHIRP_FREQ_START_VAR, CHIRP_IDLE_TIME_VAR and CHIRP_ADC_START_TIME_VAR. This feature can be used to reduce the size of the parameter in LUT if dynamic range of the parameter is small.</p> <p>Valid Range: 0 to 2</p> <table border="0"> <thead> <tr> <th>CHIRP_PARAM_INDEX</th> <th>type</th> <th>value 0</th> <th>value 1</th> <th>value 2</th> </tr> </thead> <tbody> <tr> <td>CHIRP_FREQ_START_VAR</td> <td></td> <td>4 bytes</td> <td>2 bytes</td> <td>1 byte</td> </tr> <tr> <td>CHIRP_IDLE_TIME_VAR</td> <td></td> <td>2 bytes</td> <td>1 byte</td> <td>-</td> </tr> <tr> <td>CHIRP_ADC_START_TIME_VAR</td> <td></td> <td>2 bytes</td> <td>1 byte</td> <td>-</td> </tr> </tbody> </table> <p>Default Value: 0 (default size)</p>	CHIRP_PARAM_INDEX	type	value 0	value 1	value 2	CHIRP_FREQ_START_VAR		4 bytes	2 bytes	1 byte	CHIRP_IDLE_TIME_VAR		2 bytes	1 byte	-	CHIRP_ADC_START_TIME_VAR		2 bytes	1 byte	-

Table 5.45 – continued from previous page

LUT_CHIRP_PARAM_SCALE	1	<p>This field is applicable only for LUT chirp parameters (LUT Dither) of type CHIRP_FREQ_START_VAR, CHIRP_IDLE_TIME_VAR and CHIRP_ADC_START_TIME_VAR. This feature can be used to reduce the size of the parameter in LUT if granularity of the resolution can be increased.</p> <p>Valid Range: 0 to 16 The actual parameter value for the defined chirp is given by: $2^{SCALE} * LUT_PARAM_VALUE$ Default Value: 0 (no scale) Refer to the corresponding rows in the Generic SW Chirp Parameter LUT description Table 5.48 for more info.</p>
MAX_TX_PHASE_SHIFTER_INTERNAL_DITHER	2	<p>This field is applicable only if SFn_CHIRP_PARAM_DELTA increment (Delta Dither) is enabled for TXn_PHASE_SHIFTER parameter. It controls the TX phase quantization process. The device's internal TX phase shifters are 6 bit. For deriving the internal 6 bit phase, the 16 bit SFn_CHIRP_PARAM_DELTA is accumulated in the firmware every chirp. The accumulator's output is added with a random number from 0 to this field's value. The 6 MSBs of the adder's output are used as the internal 6 bit phase for that chirp.</p> <p>Valid Range: 0 to 1023 Default Value: 0 (no dither)</p>
RESERVED	8	RESERVED

Fixed Delta Chirp Parameter description table:

Here is the description of SFn_CHIRP_PARAM_DELTA for each relevant parameter in Advanced Chirp Config API. This fixed delta is being incremented every N chirps as per update period defined in this API and the start value of the accumulator is 0 for first chirp. The accumulated delta is being added to LUT dither value and to the profile config setting in HW. This fixed delta increment feature helps to reduce the need of dedicated chirp RAM for each chirp if pattern can be generated in fixed increment fashion for each chirp.

Table 5.46: ADV_CHIRP_FIXED_DELTA_PARAM description

Parameter	LSB definition	Description
CHIRP_FREQ_START_VAR	1 LSB = $3.6e9/2^{26}$ Hz \approx 53.644 Hz Signed Valid Range: -0x058E38E3 to 0x058E38E3 +/-5GHz range (Depending on max range of VCO)	<p>The start frequency dither fixed delta increment value. This field is signed and has higher dynamic range compared to legacy chirp configuration API.</p> <p>Limitations: If accumulated delta dither + LUT dither value for a chirp is negative or \geq 450MHz then Fw internally has to update the start freq of the profile of corresponding chirp dynamically in HW and this leads to limitation as mentioned below.</p> <p>If accumulated delta dither + LUT dither value is negative or \geq +/-450MHz for 2nd chirp in a burst then due to Hw limitation the both first and 2nd chirps will be programmed with same start frequency i.e accumulated delta + LUT dither belongs to 2nd chirp. The chirps beyond 1st chirp will have proper start frequency programmed as expected, the 1st chirp start frequency would be bad, so it is recommended to discard the first chirp.</p> <p>NOTE: The Profile start freq + Accumulated delta dither + LUT dither for a chirp should not exceed the VCO range. NOTE: If GLOBAL_RESET_MODE is set to 0 (end of frame) or 1 (end of sub-frame) then above limitation is applicable at start of each burst of a sub-frame.</p>

Continued on next page

Table 5.46 – continued from previous page

CHIRP_FREQ_ SLOPE_VAR	1 LSB = $3.6e9 \times 900/2^{26} \approx$ 48.279 kHz Signed Valid Range: -63 to 63 +/-3MHz/us range	The slope dither fixed delta increment value. This field is signed Limitations: If accumulated delta dither + LUT dither value for a chirp is negative or $\geq 3\text{MHz/us}$ then Fw internally has to update the slope of the profile of corresponding chirp dynamically in HW and this leads to limitation as mentioned below. If accumulated delta dither + LUT dither value is negative or $\geq +/-3\text{MHz}$ for 2nd chirp in a burst then due to Hw limitation the both first and 2nd chirps will be programmed with same slope i.e accumulated delta dither + LUT dither belongs to 2nd chirp. The chirps beyond 1st chirp will have proper slope programmed as expected, the 1st chirp slope would be bad, so it is recommended to discard the first chirp. NOTE: The Profile slope + Accumulated delta dither + LUT dither for a chirp should not exceed the max slope range of VCO. NOTE: If GLOBAL_RESET_MODE is set to 0 (end of frame) or 1 (end of sub-frame) then above limitation is applicable at start of each burst of a sub-frame.
CHIRP_IDLE_ TIME_VAR	1 LSB = 10 ns, unsigned Valid range: 0 to 4095 0 to 40.95us range	The idle time dither fixed delta increment value. This field is unsigned. NOTE: The Accumulated delta dither + LUT dither for a chirp should not exceed the max idle time dither value 40.95us (4095 value).

Continued on next page

Table 5.46 – continued from previous page

CHIRP_ADC_START_TIME_VAR	1 LSB = 10 ns, unsigned Valid range: 0 to 4095 0 to 40.95us range	The ADC start time dither fixed delta increment value. This field is unsigned. NOTE: The Accumulated delta dither + LUT dither for a chirp should not exceed the max ADC start time dither value 40.95us (4095 value).
TX0_PHASE_SHIFTER	1 LSB = $360^\circ/2^{16}$ = 0.005493°, unsigned Valid range: 0 to 65535 0to360° range	The per chirp TX0 phase shifter fixed delta increment value. This field is unsigned and has finer resolution compared to LUT per chirp dither value.
TX1_PHASE_SHIFTER	1 LSB = $360^\circ/2^{16}$ = 0.005493°, unsigned Valid range: 0 to 65535 0to360° range	The per chirp TX1 phase shifter fixed delta increment value. This field is unsigned and has finer resolution compared to LUT per chirp dither value.
TX2_PHASE_SHIFTER	1 LSB = $360^\circ/2^{16}$ = 0.005493°, unsigned Valid range: 0 to 65535 0to360° range	The per chirp TX2 phase shifter fixed delta increment value. This field is unsigned and has finer resolution compared to LUT per chirp dither value.

NOTE1: If fixed delta dither is used to generate the pattern then it is recommended to program same start frequency in profile config API for each chirps in a frame. Each chirp can have different profiles associated with it except start frequency.

NOTE2: The number of chirps programmed in a burst/frame shall be multiple of 4. Exception: a single chirp can be programmed in a burst.

5.5.22 Sub block 0x0115 – AWR_ADVANCE_CHIRP_GENERIC_LUT_LOAD_SB

This API sub-block loads the unique dither values for each chirp on Generic SW Chirp Parameter LUT at offset address defined in [AWR_ADVANCE_CHIRP_CONF_SB](#) API. This LUT can be used to pre-load dither patterns for each chirp parameters and provides the flexibility to program any number of unique dithers for each chirp parameters.

NOTE1:	The Generic SW Chirp Parameter LUT can be modified by the host dynamically, as long as the LUT addresses modified differ from the addresses used in the current frame.
NOTE2:	The dynamic update of this API is effective immediately and does not depend on AWR_DYN_CHIRP_ENABLE_SB API. This might impact the ongoing chirps if timing of the update is not handled properly as if ongoing chirps use same fields/addresses in LUT. It is recommended to perform proper timing analysis before updating the LUT dynamically considering SPI communication delays.
NOTE3:	The total size of Generic SW Chirp Parameter LUT is 12kB.
NOTE4:	The start address offset of all chirp parameter in LUT shall be multiple of 4 bytes (word boundary), that means minimum 4 bytes in LUT shall be allocated to each chirp parameter.
NOTE5:	At least one dither parameter value shall be programmed for each chirp parameter type (10 types) in generic LUT, same value can be programmed to all chirps in a burst/frame using Advance chirp config API, LUT_PARAM_UPDATE_PERIOD (K) = 0 configuration.

Table 5.47 describes the contents of this sub block.

Table 5.47: AWR_ADVANCE_CHIRP_GENERIC_LUT_LOAD_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0116
SBLKLEN	2	Value = 232
RESERVED	12	0x0000
LUT_ADDRESS_OFFSET	2	Start address offset in LUT at which to populate the bytes of patterns. Address offset has to be multiple 4 bytes (word boundary)
NUM_OF_BYTES	2	Number of valid bytes to load in LUT Valid range: 4 to 212 bytes, must be multiple of 4 bytes.
DATA_BYTES	212	Byte array to load in to the Generic SW Chirp Parameter LUT. The description and size of the chirp parameters defined in Table 5.48 below. NOTE: The size of this sub-block is fixed to total 232 bytes, hence it is recommended to group multiple chirp parameters and send in chunks.

Generic SW Chirp Parameter LUT parameters description table:

Here is the description of chirp parameter dithers which are programmed at LUT_PATTERN_ADDRESS_OFFSET address in Generic LUT defined in Advanced Chirp Config API. The index

to this LUT is being incremented every K chirps as per update period defined in Advanced Chirp Config API and the index to LUT is 0 (at offset address) for first chirp. This LUT dither is being added to accumulated delta value and to the profile config setting in HW. This generic LUT helps to program unique dithers in device chirp RAM only for certain chirp parameters based on wave-form generation need, there is no need to program the dithers for chirp parameters which are not required to be dithered unlike legacy AWR_CHIRP_CONF_SET_SB API.

Table 5.48: ADV_CHIRP_GENERIC_LUT_PARAM description

Parameter	LSB definition and Size	Description
CHIRP_PROFILE_SELECT	Valid Range: 0 to 3 Size: 4 bits for each parameter Min Size in LUT: 4 Bytes (Up to 8 parameters)	Each byte can hold profile index parameter for 2 chirps in LUT. Index 0 and 1 refer to the first and second parameters in LUT. Bit Field Parameter b3:0 0th Profile index parameter in LUT (Mandatory field) b7:4 1st Profile index parameter in LUT (optional - in case 0th fixed profile wants to be used for all chirps in a burst/frame)

-------------------	---	---

Limitations:

Limitation 1: The first chirp in a burst (AFC) or in a legacy frame shall be discarded due to Hw limitation in below cases:

- If start frequency dither is negative for 2nd chirp of a burst/frame (either due to delta increment or due to LUT value).
Workaround: program a small negative dither for 1st chirp in LUT.
- If start frequency dither is $\geq \pm 450\text{MHz}$ for 2nd chirp of a burst/frame (either due to delta increment or due to LUT value).
Workaround: Discard 1st chirp data.
- If slope dither is negative for 2nd chirp of a burst/frame (either due to delta increment or due to LUT value).
Workaround: program a small negative dither for 1st chirp in LUT.
- If slope dither is $\geq \pm 3\text{MHz/us}$ for 2nd chirp of a burst/frame (either due to delta increment or due to LUT value).
Workaround: Discard 1st chirp data.

Limitation 2: The minimum chirp duration or cycle time shall be 25us if advance chirp feature is used (vs 13us in case of legacy chirp config API is used).

5.5.23 Sub block 0x0117 – AWR_MONITOR_TYPE_TRIG_CONF_SB

This is a new feature addition in **AWR2243**. This API helps to maintain monitoring timing synchronization in cascaded devices to avoid mutual interference of monitors running in different devices in the cascade sensor. The host must trigger the monitor of types below to avoid interference if MONITORING_MODE is set to '1' in [AWR_CALIB_MON_TIME_UNIT_CONF_SB](#). The monitors can be categorized into 3 types. The [AWR_AE_RF_MONITOR_TYPE_TRIGGER_DONE_SB](#) AE will be sent once monitor type is executed.

Table 5.49: Types of Monitors

Monitor Types	Description
Type 0	Non-transmitting monitor, The execution of non-transmitting monitors does not cause RF interference to monitors executing on other devices. Therefore, they can be executed in parallel across all devices in the cascade. These include monitors which receive a test signal through RX LNA and digital monitors.
Type 1	Transmitting but not receiving (test signal), The monitors that transmit but don't receive any test signal through RX LNA are not susceptible to interference. Therefore, they can be executed in parallel across all devices in the cascade, but not when monitors that receive test signals through RX LNA are executing.
Type 2	Transmitting and receiving (test signal), The monitors that transmit and also receive test signal through RX LNA are susceptible to interference. They can be executed sequentially so as to create time separation between monitoring chirps of different devices.

RESERVED	7	0x0

- NOTE1:** The Host can trigger all 3 types of monitor at same time or can trigger each type one after other based on system requirement, in case host is triggering monitor types one after other, then it is recommended to follow order type 0, type 1 and type 2 respectively.
- NOTE2:** The Host must wait for [AWR_AE_RF_MONITOR_TYPE_TRIGGER_DONE_SB](#) AE before issuing trigger for next monitor type.
- NOTE3:** The Host must ensure all types of monitors are executed within defined device FTTI interval, otherwise device can not finish all the monitors within FTTI and will report failure AE [AWR_CAL_MON_TIMING_FAIL_REPORT_AE_SB](#)

5.6 Sub blocks related to AWR_RF_DYNAMIC_CONF_GET_SB

5.6.1 Sub block 0x0120 – AWR_PROFILE_CONF_GET_SB

This sub block reads the parameters of a given profile. The profile details are available as part of the acknowledgment. The structure is same as AWR_PROFILE_CONF_SET_SB
 Table 5.52 describes the contents of this sub block.

Table 5.52: AWR_PROFILE_CONF_GET_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0120
SBLKLEN	2	Value = 8
PROFILE_INDX	2	Valid range 0 to 3 Index of the profile which is to be read
RESERVED	2	0x0000

5.6.2 Sub block 0x0121 – AWR_CHIRP_CONF_GET_SB

This sub block reads the parameters of a given chirp. The profile details are available as part of the acknowledgement. The structure is same as AWR_CHIRP_CONF_SET_SB
 Table 5.53 describes the contents of this sub block.

Table 5.53: AWR_CHIRP_CONF_GET_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0121
SBLKLEN	2	Value = 8
CHIRP_START_INDX	2	Valid range 0 to 511 Starting index of the chirp which is to be read
CHIRP_END_INDX	2	Valid range 0 to 511 Ending index of the chirp which is to be read

5.6.3 Sub block 0x0122 – AWR_FRAME_CONF_GET_SB

This sub block reads the parameters of the configured frame. The profile details are available as part of the acknowledgement. The structure is same as AWR_FRAME_CONF_SET_SB
 Table 5.54 describes the contents of this sub block.

Table 5.54: AWR_FRAME_CONF_GET_SB contents

5.7 Sub blocks related to AWR_FRAME_TRIG_MSG

5.7.1 Sub block 0x0140 – AWR_FRAMESTARTSTOP_CONF_SB

This sub block starts or stops transmission of frames.

Table 5.58 describes the contents of this sub block.

Table 5.58: AWR_FRAMESTARTSTOP_CONF_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x0140
SBLKLEN	2	Value = 8

Continued on next page

Table 5.58 – continued from previous page

START_STOP_CMD	2	Value	Definition
		0x0000	Stop the transmission of frames after the current frame is over at frame boundary
		0x0001	Trigger a frame in software triggered mode. In hardware SYNC_IN triggered mode, this command allows subsequent SYNC_IN trigger to be honored
		0x0002	Stop the transmission of frames after the current sub-frame is over at sub-frame boundary
		0x0003	Stop the transmission of frames after the current burst is over at burst boundary
		0x0004	Stop the transmission of frames immediately which are waiting for HW trigger or sub-frame trigger (applicable only for HW/sub-frame triggered mode when active frames are not running)
RESERVED	2	0x0000	

NOTE1:	When Frame Stop command with 'option-0' is sent to RadarSS, the frame will be stopped after completing all the chirps of a Frame/Advance frame.
NOTE2:	In non periodic Hw triggered mode or in sub-frame triggered mode, if frame needs to be stopped immediately then frame stop command with 'option-4' can be used. The 'option-4' can not be used when active frames are running.
NOTE3:	Recommended to re-issue frame configuration API if frame is not stopped at sub-frame boundary, this is to re-config CSI2 or LVDS data path configuration in MSS.

5.8 Sub blocks related to AWR_RF_ADVANCED_FEATURES_CONF_SET_MSG

5.8.1 Sub block 0x0180 – AWR_BPM_COMMON_CONF_SET_SB

This API sub block defines static configurations related to BPM (Binary Phase Modulation) feature in each of the TXs. E.g. the source of the BPM pattern (one constant value for each chirp as defined, or intra-chirp pseudo random BPM pattern as found by a programmable LFSR or a programmable sequence inside each chirp), are defined here.

Table 5.59 describes the contents of this sub block.

Table 5.59: AWR_BPM_COMMON_CONF_SET_SB contents

PF3_RX3_QSQ	2	RMS power in Q chain for profile 3, RX channel 3 (post DC and IQ mismatch correction) represented by a 16 bit unsigned number 1 LSB = $1V^2/2^{15}$ referred to ADC input
PF3_RX3_IQ-CORR	4	Cross correlation between I and Q chains for profile 3, RX channel 3 (post DC and IQ mismatch correction) represented by a 32 bit signed number 1 LSB = $1V^2/2^{30}$ referred to ADC input

5.11 Sub blocks related to AWR_RF_MISC_CONF_SET_MSG

5.11.1 Sub block 0x02C0 – RESERVED

5.11.2 Sub block 0x02C1 – RESERVED

5.11.3 Sub block 0x02C2 – AWR_RF_TEST_SOURCE_CONFIG_SET_SB

This sub block is used to configure the test source of BSS

NOTE1:	The test source configuration APIs are supported only for debug purpose. Please refer latest DFP release note for more info.
NOTE2:	After test source usage, it is recommend to disable the test source and issue profile configuration API again for normal functionality of radar.

Table 5.73 describes the content of this sub block.

Table 5.73: AWR_RF_TEST_SOURCE_CONFIG_SET_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x02C2
SBLKLEN	2	Value = 72
POSITION_VEC1	[2+2+2]	Relative position in Cartesian coordinate from radar to objects, [x, y, z] (all signed, though for y, only unsigned makes sense if forward looking: our radar is on y=0 plane). Object 0 [x,y,z] 1 LSB = 1 cm Valid Range: y: 0 to 32767 cm, x & z: \pm 32767 cm
VELOCITY_VEC1	[2+2+2]	Relative velocity in Cartesian coordinate, similar to position vector (all signed) Object 0 1 LSB = 1 cm/s Valid Range = +/- 5000 (i.e. +/-180 kmph)
SIG_LEV_VEC1	[2]	Reflecting objects' signal level at ADC output, relative to ADC Full Scale 1 LSB = -0.1 dBFS Valid range: 0 to 950 The same field may be used to emulate enable/disable each object by programming appropriate levels.
BOUNDARY_MIN_VEC1	[2+2+2]	Boundary minimum limit for each of x, y, z. When the current position crosses this boundary, the emulator returns the corresponding coordinate to the originally programmed value. Object 1 [x,y,z] 1 LSB = 1 cm Valid Range: y: 0 to 32767 cm, x & z: \pm 32767 cm
BOUNDARY_MAX_VEC1	[2+2+2]	Boundary maximum limit for each of x, y, z. When the current position crosses this boundary, the emulator returns the corresponding coordinate to the originally programmed value. Object 1 [x,y,z] 1 LSB = 1 cm Valid Range: y: 0 to 32767 cm, x & z: \pm 32767 cm

		0	3.3 V IO supply
		1	1.8 V IO supply

5.11.7 Sub block 0x02CD – AWR_RF_PALOOPBACK_CFG_SB

This sub block enables/disables PA loopback for all enabled profiles. This is used to debug both the TX and RX chains are working correctly.

NOTE: The PA loop-back configuration API is supported only for debug purpose. Please refer latest DFP release note for more info.

Table 5.76 describes the content of this sub block.

NOTE: If monitoring is enabled with the loopback APIs (subblock 0x02CD, 0x02CE, 0x02CF), then loopback will not work after monitoring is complete. To use loopback with monitoring, use AWR_ADVANCED_FRAME_CONF_SB with AWR_LOOPBACK_BURST_CONF_SB.

Table 5.76: AWR_RF_PALOOPBACK_CFG_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x02CD
SBLKLEN	2	Value = 8
PA_LOOPBACK_FREQ	2	This value is a 100 MHz divider which sets the loopback frequency For e.g. for a 1 MHz frequency, set this to 100 For a 2 MHz frequency, set this to 50 NOTE: To ensure no leakage of signal power, user has to ensure that 100 MHz/LOOPBACK_FREQ is an integer multiple of bin width For e.g. if user chooses 25 Msps sampling rate and 2048 samples/chirp, then LOOPBACK_FREQ of 64 (=1.5625 MHz) will ensure no leakage
PA_LOOPBACK_EN	1	Value Description 0 PA loopback is not enabled 1 PA loopback is enabled
RESERVED	1	0x00

5.11.8 Sub block 0x02CE – AWR_RF_PSLOOPBACK_CFG_SB

This sub block enables/disables PS (phase shifter) loopback for all enabled profiles. This is used to debug the TX (before the PA) and RX chains.

NOTE: The PS loop-back configuration API is supported only for debug purpose. Please refer latest DFP release note for more info.

Table 5.77 describes the content of this sub block.

NOTE: If monitoring is enabled with the loopback APIs (subblock 0x02CD, 0x02CE, 0x02CF), then loopback will not work after monitoring is complete. To use loopback with monitoring, use AWR_ADVANCED_FRAME_CONF_SB with AWR_LOOPBACK_BURST_CONF_SB.

5.13 Sub blocks related to AWR_RF_ASYNC_EVENT_MSG1

NOTE1: All the Monitoring Async events will be sent out periodically at CAL_MON_TIME_UNIT frame rate (FTTI). The RadarSS/BSS has a queue to hold max 8 transmit API messages (AEs or Responses), the host shall service all the AEs before start of the next FTTI epoch to avoid RadarSS Queue full CPU fault fatal error.

NOTE2: In reporting mode 1 (Quiet mode) if any failure in RadarSS analog or digital monitors the AWR2243 device will send AWR_AE_MSS_RFERROR_STATUS_SB AE with error code 0x7 along with failure monitoring report.

5.13.11 Sub block 0x100A – AWR_AE_RF_MONITOR_TYPE_TRIGGER_DONE_SB

This sub block indicates that, the triggered monitor types are done with execution and Host can use this signal to trigger next type of monitor.

Table 5.85 describes the content of this sub block.

Table 5.85: AWR_AE_RF_MONITOR_TYPE_TRIGGER_DONE_SB response contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x100A
SBLKLEN	2	Value = 16
MON_TRIG_TYPE_DONE	1	The bit mask to indicate execution status of monitor triggered type. Bit Definition b0 Done Status of Type 0 monitor trigger b1 Done Status of Type 1 monitor trigger b2 Done Status of Type 2 monitor trigger b31:3 RESERVED
RESERVED	3	0x0
TIME_STMP	4	The device time stamp at which this AE is sent out 1 LSB = 1 millisecond (time stamp rolls over upon exceeding allotted bit width)
RESERVED	4	0x0

NOTE1: The Done status for each type is cleared only once in end of FTTI interval, example the AE report for type 2 will contains done status bit set for all types.

NOTE2: If Trigger is done with all 3 bits set (Triggering all 3 types in one go), then still this AE will be sent 3 times for 3 types irrespective of number of trigger.

5.13.12 Sub block 0x100B – AWR_AE_RF_FRAME_TRIGGER_RDY_SB

This sub block indicates that the slave device is now ready to receive the external sync in for frame triggers, this does not indicate physical trigger of frames in Hw triggered mode. In SW triggered mode, this async event indicates that frame is triggered by Sw.

Table 5.86 describes the content of this sub block.

Table 5.86: AWR_AE_RF_FRAME_TRIGGER_RDY_SB response contents

5.13.27 Sub block 0x1019 – AWR_MONITOR_RX_NOISE_FIGURE_REPORT_AE_SB

This API is a Monitoring Report API which the AWR device sends to the host, containing the measured RX noise figure values corresponding to the full IF band of a profile. The AWR device sends this to host at the programmed periodicity or when failure occurs, as programmed by the configuration API SB.

Table 5.97: AWR_MONITOR_RX_NOISE_FIGURE_REPORT_AE_SB contents

Field Name	Number of bytes	Description																				
SBLKID	2	Value = 0x1019

5.13.29 Sub block 0x101B – AWR_MONITOR_TX0_POWER_REPORT_AE_SB

NOTE1:	The TX[0:2] power monitoring accuracy degrades at high TX back-offs and is unreliable for backoffs higher than 20dB.
NOTE2:	The 0dB back-off corresponds to typically 13dBm power level in AWR2243 device.

This API is a Monitoring Report API which the AWR device sends to the host, containing the

measured TX power values during an explicit monitoring chirp. The AWR device sends this to host at the programmed periodicity or when failure occurs, as programmed by the configuration API SB.

5.14.16 Sub block 0x1031 – AWR_MONITOR_RX_MIXER_IN_POWER_REPORT_AE_SB

This API is a Monitoring Report API which the AWR device sends to the host, containing the measured RX mixer input voltage swing values. The AWR device sends this to host at the programmed periodicity or when failure occurs, as programmed by the configuration API SB.

Table 5.119: AWR_MONITOR_RX_MIXER_IN_POWER_REPORT_AE_SB contents

5.14.17 Sub block 0x1033 – AWR_MONITOR_SYNTHESIZER_FREQUENCY_NONLIVE_REPORT_AE_SB

This is a new feature addition in AWR2243 device. This API is a Non live Monitoring Report SB, which device sends to the host, containing information related to measured frequency error during the monitoring chirp for two profiles configurations. The device sends this to host at the programmed periodicity or when failure occurs, as programmed by the configuration API SB.

Table 5.120: AWR_MONITOR_SYNTHESIZER_FREQUENCY_NONLIVE_REPORT_AE_SB contents

MODE_SELECT	1	<p>This field specifies the mode of operation for the PMIC clock generation. Applicable only in case of PMIC clock enable. Else ignored.</p> <p>Value Description</p> <p>0x0 Continuous mode (free running mode where the frequency change/jump is triggered based on configured number of PMIC clock ticks)</p> <p>0x1 Chirp-to-Chirp staircase mode (frequency change/jump is triggered at every chirp boundary)</p>
FREQ_SLOPE	4	<p>Applicable only in case of PMIC clock enable. Else ignored.</p> <p>Bit Description</p> <p>b25:0 Frequency slope value to be applied in [7.18] unsigned format 1 LSB = $1/2^{18}$</p> <p>b31:26 RESERVED</p> <p>In continuous mode this value is accumulated every PMIC clock tick with the seed as MIN_NDIV_VAL till MAX_NDIV_VAL is reached</p> <p>In the stair case mode this value is accumulated every chirp with the seed as MIN_NDIV_VAL till MAX_NDIV_VAL is reached</p>
MIN_NDIV_VAL	1	<p>Applicable only in case of PMIC clock enable. Else ignored.</p> <p>Minimum allowed divider value (depends upon the highest desired clock frequency)</p>
MAX_NDIV_VAL	1	<p>Applicable only in case of PMIC clock enable. Else ignored.</p> <p>Maximum allowed divider value (depends upon the lowest desired clock frequency)</p>
CLK_DITHER_EN	1	<p>Applicable only in case of PMIC clock enable and frequency slope is non-zero. Else ignored.</p> <p>This field controls the enable-disable of the clock dithering. Adds a pseudo random real number (0 or 1) to the accumulated divide value. Hence it brings a random dithering of 1 LSB.</p> <p>Value Description</p> <p>0x0 Clock dithering disabled</p> <p>0x1 Clock dithering enabled</p>
RESERVED	1	0x00

Example 1. PMIC clock with no slope in continuous mode

Objective: To configure the PMIC clock at frequency of 2 MHz with no slope.

Configurations:

1. PMICCLK_SRC = 0x2 (600 MHz PLL divided clock)
2. SRCLOCK_DIV = 29, Reference clock = $600 \text{ MHz} / (29 + 1) = 20 \text{ MHz}$
3. MIN_NDIV_VAL = MAX_NDIV_VAL = 10 (Computed as $20 \text{ MHz} / 2.0 \text{ MHz}$)
4. FREQ_SLOPE = 0

With the above configuration, the PMIC clock frequency would be $\text{PMIC clock} = (20 \text{ MHz} / 10) = 2 \text{ MHz}$

Example 2. Dithered PMIC clock with slope in chirp-to-chirp staircase mode

Objective: To configure a dithered PMIC clock at frequencies ranging from 2 MHz to 2.5 MHz over 32 chirps.

Configurations:

1. PMICCLK_SRC = 0x2 (600 MHz PLL divided clock)
2. SRCLOCK_DIV = 2, Reference clock = $600 \text{ MHz} / (2 + 1) = 200 \text{ MHz}$
3. MODE_SELECT = 1
4. FREQ_SLOPE = 169125 (Computed as $(\text{MAX_NDIV_VAL} - \text{MIN_NDIV_VAL}) \times 2^{18} / 31$)
5. MIN_NDIV_VAL = 80 (Computed as $200 \text{ MHz} / 2.5 \text{ MHz}$)
6. MAX_NDIV_VAL = 100 (Computed as $200 \text{ MHz} / 2.0 \text{ MHz}$)
7. CLK_DITHER_EN = 1

With the above configuration, the PMIC clock frequency would be vary between $(200 \text{ MHz} / 80)$ and $(200 \text{ MHz} / 100)$ in steps of $(200 \text{ MHz} / [(80 + (N \times \text{FREQ_SLOPE} / 2^{18} + X))])$ where

- N = Chirp number
- X = random fractional value in the range (0, 1) that adds the dither

The PMIC clock frequency is determined by the clock divider value which starts with a value of 100, providing a PMIC clock of 2 MHz for the 1st chirp, decrementing the divider by $\text{FREQ_SLOPE} / 2^{18} = 0.64516$ every chirp and finally reaching a value of 20 for the 32nd chirp providing a PMIC clock of 2.5 MHz.

Table 5.131: PMIC clock frequency across chirps in chirp-to-chirp staircase mode in an example when PMIC clock varies from 2 MHz to 2.5 MHz in 32 chirps

Chirp Number	PMIC Clock Frequency (MHz)	Calculation
1	2.50000	$200/(80 + 0 \times 169125/2^{18})$
2	2.48000	$200/(80 + 1 \times 169125/2^{18})$
3	2.46032	$200/(80 + 2 \times 169125/2^{18})$
4	2.44094	$200/(80 + 3 \times 169125/2^{18})$
5	2.42188	$200/(80 + 4 \times 169125/2^{18})$
6	2.40310	$200/(80 + 5 \times 169125/2^{18})$
7	2.38462	$200/(80 + 6 \times 169125/2^{18})$
8	2.36641	$200/(80 + 7 \times 169125/2^{18})$
9	2.34848	$200/(80 + 8 \times 169125/2^{18})$
10	2.33083	$200/(80 + 9 \times 169125/2^{18})$
11	2.31343	$200/(80 + 10 \times 169125/2^{18})$
12	2.29630	$200/(80 + 11 \times 169125/2^{18})$
13	2.27941	$200/(80 + 12 \times 169125/2^{18})$
14	2.26277	$200/(80 + 13 \times 169125/2^{18})$
15	2.24638	$200/(80 + 14 \times 169125/2^{18})$
16	2.23022	$200/(80 + 15 \times 169125/2^{18})$
17	2.21429	$200/(80 + 16 \times 169125/2^{18})$
18	2.19858	$200/(80 + 17 \times 169125/2^{18})$
19	2.18310	$200/(80 + 18 \times 169125/2^{18})$
20	2.16783	$200/(80 + 19 \times 169125/2^{18})$
21	2.15278	$200/(80 + 20 \times 169125/2^{18})$
22	2.13793	$200/(80 + 21 \times 169125/2^{18})$
23	2.12329	$200/(80 + 22 \times 169125/2^{18})$
24	2.10884	$200/(80 + 23 \times 169125/2^{18})$
25	2.09459	$200/(80 + 24 \times 169125/2^{18})$
26	2.08054	$200/(80 + 25 \times 169125/2^{18})$
27	2.06667	$200/(80 + 26 \times 169125/2^{18})$
28	2.05298	$200/(80 + 27 \times 169125/2^{18})$
29	2.03947	$200/(80 + 28 \times 169125/2^{18})$
30	2.02614	$200/(80 + 29 \times 169125/2^{18})$
31	2.01299	$200/(80 + 30 \times 169125/2^{18})$
32	2.00000	$200/(80 + 31 \times 169125/2^{18})$

Example 3. Dithered PMIC clock with slope in continuous mode

Objective: To configure a dithered PMIC clock at frequencies ranging from 2 MHz to 2.5 MHz over 100 μ s.

Configurations:

1. PMICCLK_SRC = 0x2 (600 MHz PLL divided clock)
2. SRCLOCK_DIV = 2, Reference clock = 600 MHz / (2 + 1) = 200 MHz
3. MODE_SELECT = 0
4. FREQ_SLOPE = 23302 (Computed as $(MAX_NDIV_VAL - MIN_NDIV_VAL) \cdot 2^{18} / (100 \mu s \cdot (2.5 \text{ MHz} + 2 \text{ MHz}) / 2)$)
5. MIN_NDIV_VAL = 80 (Computed as 200 MHz / 2.5 MHz)
6. MAX_NDIV_VAL = 100 (Computed as 200 MHz / 2.0 MHz)
7. CLK_DITHER_EN = 1

With the above configuration, the PMIC clock frequency would be PMIC clock would vary between = (200 MHz / 80) to (200 MHz / 100) in steps of $(200 \text{ MHz} / [(80 + (N \times 23302 / 2^{18} + X))])$ where

- N = Iteration count that ticks every PMIC clock. The average value of PMIC clock here is $\sim 2.25 \text{ MHz}$. Hence the iteration count ticks every $(1 / 2.25 \text{ MHz}) \sim 0.444 \mu$ s.
- X = random fractional value in the range (0, 1) that adds the dither

The PMIC clock frequency is determined by the clock divider which starts with a value of 100, on the 1st PMIC clock period, providing a PMIC clock of 2 MHz, decrementing the divider value by $23303 / 2^{18} = 0.08889$ every PMIC clock period of $1 / 2.25 \text{ MHz} \sim 0.444 \mu$ s, finally reaching a value of 80 on 225th PMIC clock period, providing a PMIC clock of 2.5 MHz. Hence, the frequency varies from [2 MHz, 2.5 MHz] over 225 PMIC clock periods or $225 \times 0.444 \mu$ s or $\sim 100 \mu$ s.

5.16.10 Sub block 0x4049 – AWR_MSS_PERIODICTESTS_CONF_SB

This sub block is used to trigger the periodic tests in MSS.

Table 5.132 describes the content of this sub block.

Table 5.132: AWR_MSS_PERIODICTESTS_CONF_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x4049
SBLKLEN	2	Value = 16

Continued on next page

Table 5.132 – continued from previous page

PERIODICITY	4	Periodicity at which tests need to be run 1 LSB = 1 ms Minimum value is 40 ms Maximum value is 150ms NOTE: MSS Windowed WDT period is set to this periodicity and WDT can not support period more than 150ms.
TEST_EN	4	1 – Enable, 0 – Disable Bit Monitoring type b0 PERIODIC_CONFIG_REGISTER_READ_EN b1 ESM_MONITORING_EN b31:2 RESERVED
REPORTING_MODE	1	Controls when the AWR device sends the report corresponding to the periodic tests to the host. A report generically refers to both success/failure status flags. Value Definition 0 Report is sent every monitoring period 1 Report is sent only on a failure
RESERVED	3	0x000000

NOTE: The MSS periodic monitor test run and latent tests are not recommended to run in parallel as latent tests are destructive tests which would cause periodic tests to fail.

5.16.11 Sub block 0x404A – AWR_MSS_LATENTFAULT_TEST_CONF_SB

This sub block is used to trigger the periodic latent fault tests in MSS, this API should not be issued when functional frames are running, these are destructive tests.

Table 5.133 describes the content of this sub block.

Table 5.133: AWR_MSS_LATENTFAULT_TEST_CONF_SB contents

Field Name	Number of bytes	Description

TEST_MODE	1	Value	Definition
		0	Production mode. Latent faults are tested and any failures are reported
		1	Characterization mode. Faults are injected and failures are reported which allows testing of the failure reporting
RESERVED	2	0x0000	

NOTE1: The MSS latent self tests are destructive tests, which would cause corruption in ongoing SPI/mailbox transactions and may generate N-Error signals while performing ESM G2 error checks. It is recommended not to run these self tests in functional mode of operation.

NOTE2: It is recommended to wait for the latent fault test report asynchronous event after issuing this API. The MSS latent self tests cannot be issued back to back without waiting for the test report event.

5.16.12 Sub block 0x404B – AWR_DEV_TESTPATTERN_GEN_SET_SB

This sub block contains the configurations to setup the test pattern to be generated and transferred over the selected high speed interface (LVDS/CSI2). This command has to be issued after the data path configurations commands are issued. This can be used to perform a sanity test of the high speed interface connectivity and correct reception.

Table 5.134 describes the contents of this sub block.

Table 5.134: AWR_DEV_TESTPATTERN_GEN_SET_SB contents

Field Name	Number of bytes	Description															
SBLKID	2	Value = 0x404B															
SBLKLEN	2	Value = 48															
TESTPATTERN_GEN_CTRL	1	This field controls the enable-disable of the generation of the test pattern. Value Description 0x0 Disable test pattern generation 0x1 Enable test pattern generation															
TESTPATTERN_GEN_TIMING	1	Number of system clocks (200 MHz) between successive samples for the test pattern gen. Applicable only in case of Test pattern enable. Else ignored.															
TESTPATTERN_PKT_SIZE	2	Number of ADC samples to capture for each RX Valid range: 64 to MAX_NUM_SAMPLES, Where MAX_NUM_SAMPLES is such that all the enabled RX channels' data fits into 16 kB memory, with each sample consuming 2 bytes for real ADC output case and 4 bytes for complex 1x and complex 2x ADC output cases. For example in AWR2243/AWR1243/xWR1443 when the ADC buffer size is 16 kB <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Number of RX chains</th> <th>ADC format</th> <th>MAX_NUM_SAMPLES</th> </tr> </thead> <tbody> <tr> <td>4</td> <td>Complex</td> <td>1024</td> </tr> <tr> <td>4</td> <td>Real</td> <td>2048</td> </tr> <tr> <td>2</td> <td>Complex</td> <td>2048</td> </tr> <tr> <td>2</td> <td>Real</td> <td>4096</td> </tr> </tbody> </table>	Number of RX chains	ADC format	MAX_NUM_SAMPLES	4	Complex	1024	4	Real	2048	2	Complex	2048	2	Real	4096

5.16.15 Sub block 0x404E – AWR_DEV_CSI2_DELAY_DUMMY_CFG_SET_SB

This API can be used to increase the time between the availability of chirp data and the transfer of chirp data over CSI2 interface. It can also be used to add configurable amount of dummy data per chirp at the end of actual chirp data.

NOTE1:	The user should configure the delay (and the dummy count) such that the chirp data transmission is completed before the start of next chirp's data transmission. Excessive delay or dummy count may lead to fault which will be reported by MSS
NOTE2:	The change in Delay value configuration will reflect immediately. But any change in Dummy value configuration will reflect only after frame configuration.
NOTE3:	There is some delay T0 (even without enabling this API) between the chirp data availability to data transmission. The delay added by this API is in addition to this T0. T0 depends on ADC Sampling rate, CSI Data rate and whether the CSI Line-Start-Line-End is enabled or not. The programmer needs to account for this delay while selecting the configuration values for this API.

Table 5.137: AWR_DEV_CSI2_DELAY_DUMMY_CFG_SET_SB contents

5.18 Sub blocks related to AWR_DEV_FILE_DOWNLOAD_MSG

5.18.1 Sub block 0x4080 – AWR_DEV_FILE_DOWNLOAD_SB

This sub block is used to send the file in chunks/parts for download into RAM. Table [5.150](#) describes the content of this sub block.

Table 5.150: AWR_DEV_FILE_DOWNLOAD_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x4080
SBLKLEN	2	Value = Variable
FILE_TYPE	4	Value Description 0x0 META_IMAGE TO SRAM 0x1 RESERVED 0x2 RESERVED 0x3 RESERVED 0x4 META_IMAGE1 TO SFLASH 0x5 META_IMAGE2 TO SFLASH 0x6 META_IMAGE3 TO SFLASH 0x7 META_IMAGE4 TO SFLASH
FILE_LENGTH	4	Length of File
FILE_CONTENT	Variable	Content of File, may split into multiple chunks.

NOTE: In the first chunk of file, FILE_TYPE and FILE_LENGTH is available and then first chunk onward these two fields will not be part of SB content

5.19 Sub blocks related to AWR_DEV_FRAME_CONFIG_APPLY_MSG

5.19.1 Sub block 0x40C0 – AWR_DEV_FRAME_CONFIG_APPLY_SB

This sub block is used to indicate to MSS to apply all the device configurations in the hardware. This API should be used when legacy frame config is used.

Table 5.151 describes the content of this sub block.

Table 5.151: AWR_DEV_FRAME_CONFIG_APPLY_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x40C0
SBLKLEN	2	Value = 12
NUM_CHIRPS	4	Number of chirps per frame

Continued on next page

Table 5.151 – continued from previous page

HALF_WORDS_ PER_CHIRP	2	Number of half words in ADC buffer per chirp Example 1: In real mode, if number of ADC samples per chirp is 256 then this value will be 256 Example 2: In complex1x or complex2x modes, if number of ADC samples per chirp is 256 then this value will be 512
RESERVED	2	0x0000

5.19.2 Sub block 0x40C1 – AWR_DEV_ADV_FRAME_CONFIG_APPLY_SB

This sub block is used to indicate to MSS to apply all the advanced frame configuration settings in the hardware. This API should be used when advance frame config is used.

Table 5.152 describes the content of this sub block.

Table 5.152: AWR_DEV_ADV_FRAME_CONFIG_APPLY_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x40C1
SBLKLEN	2	Value = 40
NUM_SUB-FRAMES	1	Number of sub frames enabled in this frame Valid range: 1 to 4
RESERVED	3	0x00
SF1_TOT_NUM_CHIRPS	4	Number of chirps in sub frame 1

Continued on next page

Table 5.152 – continued from previous page

SF1_NUM_ADC_SAMPLES_PER_DATA_PKT	2	<p>Number of half words (16 bits) of ADC samples per data packet in sub-frame 1</p> <p>Example 1: In real mode, if number of ADC samples per chirp in subframe1 is 256 then this value will be 256</p> <p>Example 2: In complex1x or complex2x modes, if number of ADC samples per chirp in subframe1 is 256 then this value will be 512</p> <p>In AWR2243/AWR1243/xWR1443: Program this as the same as number of ADC samples in each chirp of this sub frame (required to be the same)</p> <p>Exception: Can do #chirps based ping-pong as in xWR1642 (see below), if CP/CQ are not needed. Useful for chirp stitching use case.</p> <p>In xWR1642/xWR1843 (For reference Only): The ADC samples corresponding to one or more chirps can be grouped and sent to the DSP as a single packet. Program this as the number of half words of ADC samples per packet. Ensure that in one sub frame, there is integer number of such packets.</p> <p>Maximum size of a data packet: (16384 - 1) half words.</p>
SF1_PROC_NUM_CHIRPS_PER_DATA_PKT	1	<p>Number of chirps per data packet to process at a time in sub-frame 1.</p> <p>In AWR2243/AWR1243/xWR1443: Program this as 1.</p> <p>Exception: Can be > 1 as in 1642 if CP/CQ is not needed. Useful for chirp stitching use case.</p> <p>In xWR1642/xWR1843 (For reference Only): The ADC samples corresponding to one or more chirps can be grouped and sent to the DSP as a single packet. Program this as the corresponding number of chirps per packet.</p> <p>Maximum value = 8.</p> <p>Note on maximum size: 8 chirps for CP and BPM.</p>
RESERVED	1	0x00
SF2_TOT_NUM_CHIRPS	4	Number of chirps in sub-frame 2
SF2_NUM_ADC_SAMPLES_PER_DATA_PKT	2	Number of ADC Samples per data packet in sub-frame 2 Same conditions apply as in sub-frame 1.
SF2_PROC_NUM_CHIRPS_PER_DATA_PKT	1	Number of chirps per data packet to process at a time in sub-frame 2 Same conditions apply as in sub-frame 1.
RESERVED	1	0x00
SF3_TOT_NUM_CHIRPS	4	Number of chirps in sub-frame3

RESERVED	1	0x00
SF4_TOT_NUM_CHIRPS	4	Number of chirps in sub-frame4
SF4_NUM_ADC_SAMPLES_PER_DATA_PKT	2	Number of ADC samples per data packet in sub-frame 4 Same conditions apply as in sub-frame 1.
SF4_PROC_NUM_CHIRPS_PER_DATA_PKT	1	Number of chirps per data packet to process at a time in sub-frame 4 Same conditions apply as in sub-frame 1.
RESERVED	1	0x00

5.20 Sub blocks related to AWR_DEV_STATUS_GET_MSG

5.20.1 Sub block 0x40E0 – AWR_MSSVERSION_GET_SB

This sub block reads MSS FW version. The information returned by the device will be in the format as given in AWR_MSSVERSION_SB.

Table 5.153 describes the contents of the request sub block

Table 5.153: AWR_MSSVERSION_GET_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x40E0
SBLKLEN	2	Value = 4

Response to AWR_MSSVERSION_GET_SB

AWR_MSSVERSION_SB sub block is sent by the radar device in response to AWR_MSSVERSION_GET_SB. Note that SBLKID for both AWR_MSSVERSION_GET_SB and AWR_MSSVERSION_SB are same.

Table 5.154 describes the contents of the response sub block.

Table 5.154: AWR_MSSVERSION_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x40E0
SBLKLEN	2	Value = 20
HW_VARIANT	1	HW variant number
HW_VERSION_MAJOR	1	HW version major number
HW_VERSION_MINOR	1	HW version minor number
MSS_FW_VERSION_MAJOR	1	MSS FW version major number
MSS_FW_VERSION_MINOR	1	MSS FW version minor number
MSS_FW_VERSION_BUILD	1	MSS FW version build number
MSS_FW_VERSION_DEBUG	1	MSS FW version debug number
MSS_FW_VERSION_YEAR	1	Year of MSS FW version release
MSS_FW_VERSION_MONTH	1	Month of MSS FW version release
MSS_FW_VERSION_DAY	1	Day of MSS FW version release
MSS_FW_VERSION_PATCH_MAJOR	1	MSS FW version patch major number
MSS_FW_VERSION_PATCH_MINOR	1	MSS FW version patch minor number
MSS_FW_VERSION_PATCH_YEAR	1	Year of MSS FW patch release
MSS_FW_VERSION_PATCH_MONTH	1	Month of MSS FW patch release
MSS_FW_VERSION_PATCH_DAY	1	Day of MSS FW patch release

6 API Programming Sequence

6.1 Single device mode

This section briefly describes in which order to issue the various API SBs defined in this document for a single device.

1. Power up the device
2. Wait for AWR_AE_MSSPOWERUPDONE_SB
3. AWR_DEV_CONFIGURATION_SET_SB
4. AWR_DEV_RFPOWERUP_SB
5. Wait for AWR_AE_RFPOWERUPDONE_SB
6. AWR_RF_STATIC_CONF_SET_MSG
 - a. AWR_RF_DEVICE_CFG_SB
 - b. AWR_CHAN_CONF_SET_SB
 - c. AWR_ADCOUT_CONF_SET_SB
 - d. AWR_RF_LDO_BYPASS_SB with RFLDOBYPASS_EN set to 1 if RF supply is 1.0 V
 - e. AWR_LOWPOWERMODE_CONF_SET_SB
 - f. AWR_DYNAMICPOWERSAVE_CONF_SET_SB
 - g. AWR_CAL_MON_FREQUENCY_TX_POWER_LIMITS_SB
 - h. AWR_RF_RADAR_MISC_CTL_SB if per chirp phase shifter and Advance chirp configuration needs to be enabled.
 - i. AWR_APLL_SYNTH_BW_CONTROL_SB
7. Data path configurations
 - a. AWR_DEV_RX_DATA_FORMAT_CONF_SET_SB
 - b. AWR_DEV_RX_DATA_PATH_CONF_SET_SB
 - c. AWR_DEV_RX_DATA_PATH_LANE_EN_SB
 - d. AWR_DEV_RX_DATA_PATH_CLK_SET_SB
 - e. AWR_HIGHSPEEDINTFCLK_CONF_SET_SB
 - f. AWR_DEV_LVDS_CFG_SET_SB / AWR_DEV_CSI2_CFG_SET_SB

8. AWR_RF_INIT_MSG
 - a. AWR_PHASE_SHIFTER_CAL_DATA_RESTORE_SB (To restore factory calibration data for TX0), keep CAL_APPLY = 0
 - b. AWR_PHASE_SHIFTER_CAL_DATA_RESTORE_SB (To restore factory calibration data for TX1), keep CAL_APPLY = 0
 - c. AWR_PHASE_SHIFTER_CAL_DATA_RESTORE_SB (To restore factory calibration data for TX2), keep CAL_APPLY = 1
 - d. AWR_CAL_DATA_RESTORE_SB (To restore factory calibration data to avoid on field RF interference during calibration)
 - e. Wait for AWR_AE_RF_INITCALIBSTATUS_SB
 - f. AWR_RF_INIT_CALIBRATION_CONF_SB (Enable only required calibration to run)
 - g. AWR_RFINIT_SB: This triggers very basic calibrations and RF initializations
 - h. Wait for AWR_AE_RF_INITCALIBSTATUS_SB
9. AWR_RF_DYNAMIC_CONF_SET_MSG
 - a. AWR_PROG_FILT_COEFF_RAM_SET_SB (Applicable only in xWR1642/IWR6843/xWR1843)
 - b. AWR_PROG_FILT_CONF_SET_SB (Applicable only in xWR1642/IWR6843/xWR1843)
 - c. AWR_PROFILE_CONF_SET_SB
 - d. Chirp configuration API
 - a. AWR_CHIRP_CONF_SET_SB or
 - b. AWR_ADVANCE_CHIRP_CONF_SB and
 - c. AWR_ADVANCE_CHIRP_GENERIC_LUT_LOAD_SB
 - e. AWR_LOOPBACK_BURST_CONF_SET_SB (if using loopback burst in advance frame config API)
 - f. AWR_FRAME_CONF_SET_SB or AWR_ADVANCED_FRAME_CONF_SB with SW or HW triggered mode.
 - g. AWR_CALIB_MON_TIME_UNIT_CONF_SB with CALIB_MON_TIME_UNIT value set to a value such that the total frame idle time across multiple CALIB_MON_TIME_UNITS is sufficient for all calibrations and monitoring. See Section 12 for details on calibration and monitoring durations. If any error AWR_CAL_MON_TIMING_FAIL_REPORT_AE_SB AE will be generated when frame is triggered. The calibrations and monitors will not run properly if this error is generated.
 - h. AWR_RUN_TIME_CALIBRATION_CONF_AND_TRIGGER_SB (set all ONE_TIME_CALIB_ENABLE_MASK and set ENABLE_CAL_REPORT = 1)
 - i. Wait for AWR_RUN_TIME_CALIBRATION_SUMMARY_REPORT_AE_SB
 - j. AWR_RUN_TIME_CALIBRATION_CONF_AND_TRIGGER_SB (set all RUN_TIME_CALIB_ENABLE_MASK and set ENABLE_CAL_REPORT = 0 to avoid receiving periodic async events)

- k. AWR_DEV_FRAME_CONFIG_APPLY_SB or AWR_DEV_ADV_FRAME_CONFIG_APPLY_SB

10. MONITOR CONFIGURATIONS

- a. AWR_MONITOR_RF_DIG_LATENTFAULT_CONF_SB : Wait for AWR_MONITOR_RF_DIG_LATENTFAULT_REPORT_AE_SB AE. This API should not be issue when frames are running.
- b. AWR_MSS_LATENTFAULT_TEST_CONF_SB : Wait for AWR_AE_MSS_LATENTFAULT_TESTREPORT_SB AE.
- c. AWR_MSS_PERIODICTESTS_CONF_SB : Enable periodic digital monitors, the monitor starts immediately after enabling this API.
- d. AWR_MONITOR_RF_DIG_PERIODIC_CONF_SB : Enable periodic digital monitors
- e. AWR_MONITOR_ANALOG_ENABLES_CONF_SB : Enable periodic analog monitors, The corresponding monitoring configuration APIs should be issued after issuing this API. Refer latest release note for all supported monitors.

11. AWR_RF_FRAME_TRIG_MSG

- a. AWR_FRAMESTARTSTOP_CONF_SB in Start mode (1): after this, frames get transmitted, wait for AWR_AE_RF_FRAME_TRIGGER_RDY_SB AE.

12. AWR_RF_FRAME_TRIG_MSG

- a. AWR_FRAMESTARTSTOP_CONF_SB in Stop mode (0): after this, frames are stopped. Wait for AWR_FRAME_END_AE_SB AE. The AWR_RF_FRAME_TRIG_MSG may be issued multiple times for multiple sets of frames. Refer AWR_FRAMESTARTSTOP_CONF_SB for more frame stop options.

6.2 Cascaded device mode

This section briefly describes in which order to issue the various API SBs defined in this document for master and slave devices in a cascaded configuration.

When using cascaded devices, the reference clock is provided by master to slave. So unless master is powered-up and clock is available from master to slave, the slave device cannot be powered up.

Table 6.1: Sequence of APIs to be issued to master and slave devices in cascaded mode configuration for FMCW mode measurements

Sl. No	Master device sequence	Slave device sequence
1	Power up master device	
2	Wait for AWR_AE_DEV_MSSPOWERUP-DONE_SB	

Continued on next page

Table 6.1 – continued from previous page

3	AWR_DEV_RFPOWERUP_SB	
4	Wait for AWR_AE_DEV_RFPOWERUP-DONE_SB	
5	AWR_CHAN_CONF_SET_SB with CAS-CADING_CFG = 0x0001. This will enable the reference clock for slave device (In AWR2243 this is enabled by default)	
6		Power on slave device
7		Wait for AWR_AE_DEV_MSSPOWERUP-DONE_SB
8		AWR_DEV_RFPOWERUP_SB
9		Wait for AWR_AE_DEV_RFPOWERUP-DONE_SB
10		AWR_CHAN_CONF_SET_SB with CAS-CADING_CFG = 0x0002.
11	AWR_ADCOUT_CONF_SET_SB	AWR_ADCOUT_CONF_SET_SB
12	AWR_RF_LDO_BYPASS_SB with RFLDOBYPASS_EN = 1 if RF supply is 1.0V	AWR_RF_LDO_BYPASS_SB with RFLDOBYPASS_EN = 1 if RF supply is 1.0V
13	AWR_LOWPOWERMODE_CONF_SET_SB	AWR_LOWPOWERMODE_CONF_SET_SB
14	AWR_DYNAMICPOWERSAVE_CONF_SET_SB	AWR_DYNAMICPOWERSAVE_CONF_SET_SB
15	AWR_RF_INIT_SB	AWR_RF_INIT_SB
16	Wait for AWR_AE_RF_INITIALIBSTATUS_SB	Wait for AWR_AE_RF_INITIALIBSTATUS_SB
17	AWR_DEV_RX_DATA_FORMAT_CONF_SET_SB	AWR_DEV_RX_DATA_FORMAT_CONF_SET_SB
18	AWR_DEV_RX_DATA_PATH_CONF_SET_SB	AWR_DEV_RX_DATA_PATH_CONF_SET_SB
19	AWR_DEV_RX_DATA_PATH_LANEEN_SET_SB	AWR_DEV_RX_DATA_PATH_LANEEN_SET_SB
20	AWR_HIGHSPEEDINTFCLK_CONF_SET_SB	AWR_HIGHSPEEDINTFCLK_CONF_SET_SB
21	AWR_DEV_RX_DATA_PATH_CLK_SET_SB	AWR_DEV_RX_DATA_PATH_CLK_SET_SB
22	AWR_DEV_LVDS_CFG_SET_SB/AWR_DEV_CSI2_CFG_SET_SB	AWR_DEV_LVDS_CFG_SET_SB/AWR_DEV_CSI2_CFG_SET_SB
23	AWR_PROFILE_CONF_SET_SB	AWR_PROFILE_CONF_SET_SB
24	AWR_CHIRP_CONF_SET_SB	AWR_CHIRP_CONF_SET_SB

Continued on next page

Table 6.1 – continued from previous page

25	AWR_FRAME_CONF_SET_SB with TRIGGER_SELECT = 0x0001	AWR_FRAME_CONF_SET_SB with TRIGGER_SELECT = 0x0002
26	AWR_DEV_FRAME_CONFIG_APPLY_MSG	AWR_DEV_FRAME_CONFIG_APPLY_MSG
27		AWR_FRAMESTARTSOP_CONF_SB with STARTSTOP_CMD = 0x0001
28		Wait for AWR_AE_RF_FRAME_TRIGGER_RDY_SB
29	AWR_FRAMESTARTSOP_CONF_SB with STARTSTOP_CMD = 0x0001	
30	Wait for AWR_AE_RF_FRAME_TRIGGER_RDY_SB	

6.3 Continuous streaming mode (in single device case)

This section briefly describes in which order to issue the various API SBs defined in this document to enable continuous streaming mode on a single device

1. Power up the device
2. Wait for AWR_AE_MSSPOWERUPDONE_SB
3. AWR_DEV_RFPOWERUP_SB
4. Wait for AWR_AE_RFPOWERUPDONE_SB
5. AWR_RF_MISC_CONF_SET_MSG
6. AWR_RF_STATIC_CONF_SET_MSG
 - a. AWR_CHAN_CONF_SET_SB
 - b. AWR_ADCOUT_CONF_SET_SB
 - c. AWR_RF_LDO_BYPASS_SB with RFLDOBYPASS_EN set to 1 if RF supply is 1.0V
 - d. AWR_LOWPOWERMODE_CONF_SET_SB
 - e. AWR_DYNAMICPOWERSAVE_CONF_SET_SB
7. AWR_RF_STATIC_CONF_SET_MSG
8. Data path configurations
 - a. AWR_DEV_RX_DATA_FORMAT_CONF_SET_SB
 - b. AWR_DEV_RX_DATA_PATH_CONF_SET_SB
 - c. AWR_DEV_RX_DATA_PATH_LANE_EN_SB

- d. AWR_DEV_RX_DATA_PATH_CLK_SET_SB
 - e. AWR_HIGHSPEEDINTFCLK_CONF_SET_SB
 - f. AWR_DEV_LVDS_CFG_SET_SB / AWR_DEV_CSI2_CFG_SET_SB
9. AWR_RF_INIT_MSG
 - a. AWR_RFINIT_SB: This triggers very basic calibrations and RF initializations
 - b. Wait for AWR_AE_RF_INITCALIBSTATUS_SB
 10. AWR_CONT_STREAMING_MODE_CONF_SET_SB
 11. AWR_DEV_RX_CONTSTREAMING_MODE_CONF_SET_SB
 12. AWR_CONT_STREAMING_MODE_EN_SB with CONT_STREAMING_EN = 0x0001 to start continuous streaming
 13. AWR_CONT_STREAMING_MODE_EN_SB with CONT_STREAMING_EN = 0x0000 to stop continuous streaming
 14. Repeat steps 9-11 for a different configuration

6.4 Continuous streaming (CW) mode (in cascaded device case)

Table 6.2: Sequence of APIs to be issued to master and slave devices in cascaded mode for CW mode measurements

Sl. No	Master device sequence	Slave device sequence
1	Power up master device	
2	Wait for AWR_AE_DEV_MSSPOWERUP-DONE_SB	
3	AWR_DEV_RFPOWERUP_SB	
4	Wait for AWR_AE_DEV_RFPOWERUP-DONE_SB	
5	AWR_CHAN_CONF_SET_SB with CAS-CADING_CFG = 0x0001. This will enable the reference clock for slave device	
6		Power on slave device
7		Wait for AWR_AE_DEV_MSSPOWERUP-DONE_SB
8		AWR_DEV_RFPOWERUP_SB
9		Wait for AWR_AE_DEV_RFPOWERUP-DONE_SB

Continued on next page

Table 6.2 – continued from previous page

10		AWR_RF_LDO_BYPASS_SB with RFLDOBYPASS_EN = 1 if RF supply is 1.0V

24	AWR_CONT_STREAMING_MODE_CONF_SET_SB	
25	AWR_CONT_STREAMING_MODE_EN_SB with CONT_STREAMING_EN = 0x0001 to start continuous streaming	
26		AWR_CONT_STREAMING_MODE_CONF_SET_SB with the same RF frequency configuration as in master device
27		AWR_CONT_STREAMING_MODE_EN_SB with CONT_STREAMING_EN = 0x0001 to start continuous streaming

Continued on next page

Table 6.2 – continued from previous page

28		AWR_CONT_STREAMING_MODE_EN_SB with CONT_STREAMING_EN = 0x0000 to stop continuous streaming
29	AWR_CONT_STREAMING_MODE_EN_SB with CONT_STREAMING_EN = 0x0000 to stop continuous streaming	
30	Repeat steps 24-29 for a different CW mode configuration	

7 API Error Codes

Table 7.1: BSS API error codes

Applicable to all API sub blocks	1	Incorrect API MSGID
	2	Sub block not found in the MSG
	3	Incorrect Sub block ID
	4	Incorrect Sub block length
	5	Incorrect Sub block data
	6	Error in processing the command
	7	Binary file CRC mismatch error
	8	Binary file type mismatch w.r.t. magic number
AWR_FRAMESTARTSTOP_CONF_SB	20	Frames are already started when the FRAME_START command was issued
	21	Frames are already stopped when the FRAME_STOP command was issued
	22	No valid frame configuration API was issued and frames are started
	23	START_STOP_CMD parameter is out of range
129	The frame stop option-4 can not be used in Sw triggered mode	
AWR_CHAN_CONF_SET_SB	24	RX_CHAN_EN parameter is out of range (Max range may vary based on device variant)
	25	TX_CHAN_EN parameter is out of range (Max range may vary based on device variant)
	26	CASCADING_CFG parameter is out of range [0, 2]
	282	Device variant does not allow cascading but API is issued to enable cascading mode
AWR_ADCOUT_CONF_SET_SB	27	NUM_ADC_BITS parameter is out of range [0, 2]
	28	ADC_OUT_FMT parameter is out of range [0, 3]
	127	FULL_SCALE_REDUCTION_FACTOR is > 0 for 16 bit ADC, or > 2 for 14 bit ADC mode or > 4 for 12 bit ADC mode
AWR_LOWPOWERMODE_CONF_SET_SB	29	LP_ADC_MODE parameter is out of range [0, 1]
	156	Regular ADC mode is used on a 5 MHz part variant device

8 Radar Monitoring APIs

sec:RadarMonApis

AWR monitoring can be configured through a set of API sub blocks defined in this section. Note that these APIs cover the RF/Analog related monitoring mechanisms. There are separate monitoring mechanisms for the digital logic (including the processor, memory, etc.) which are internal to the device and not explicitly enabled through these APIs.

The monitoring APIs are structured as follows. There are common configuration APIs that control the overall periodicity of monitoring, as well as, enable/disable control for each monitoring mechanism. Then, for each monitoring mechanism there is an individual API to allow the customer to set an appropriate threshold for declaring failure from that monitoring. Also, for each monitoring mechanism, there is an individual API to report soft (raw) values from that monitoring.

NOTE1: Each monitor can perform monitoring on only one profile at a time. Though it is possible that different monitors can monitor different profiles simultaneously.

NOTE2: None of the Safety Monitoring supported in QM devices except Rx saturation and signal image monitor defined in page 372, The monitoring configurations defined below from sub-block ID 0x01C0 to 0x01DF are not valid in QM devices.

NOTE3: All Monitoring configurations and enable control APIs shall be issues before triggering the frames. The run time programming or configuration update for monitors are not supported while frames are running.

8.1 Common Configurations and Reports

This section covers the APIs corresponding to the common configurations and reports.

8.1.1 Sub block 0x01C0 – AWR_MONITOR_RF_DIG_LATENTFAULT_CONF_SB

This API SB contains the consolidated configuration of all digital monitoring. This is issued by the host to the AWR device.

The enabled monitoring functions are executed when the API is issued, this API should be issued only when frames are not running, these are destructive tests. The scheduling of these monitoring should be handled in the external application. Report of these monitoring will be available in the async event [AWR_MONITOR_RF_DIG_LATENTFAULT_REPORT_AE_SB](#).

Table 8.1: AWR_MONITOR_RF_DIG_LATENTFAULT_CONF_SB contents

Table 8.1 – continued from previous page

TEST_MODE	1	Value	Definition
		0	Production mode. Latent faults are tested and any failures are reported
		1	Characterization mode. Faults are injected and failures are reported which allows testing of the failure reporting path
RESERVED	3	0x000000	
RESERVED	4	0x00000000	

NOTE: The Characterization TEST_MODE is supported only for debug, in production or run time this test mode is not supported. The device reset is required after entering this mode.

8.1.2 Sub block 0x01C1 – AWR_MONITOR_RF_DIG_PERIODIC_CONF_SB

This API SB contains the consolidated configuration of all periodic digital monitoring within radar sub-system. This is issued by the host to the AWR device.

The enabled monitoring functions are executed periodically and reports are sent based on reporting mode. Report of these monitoring will be available in the async event [AWR_MONITOR_RF_DIG_PERIODIC_REPORT_AE_SB](#).

Table 8.2: AWR_MONITOR_RF_DIG_PERIODIC_CONF_SB contents

Field Name	Number of bytes	Description	
SBLKID	2	Value = 0x01C1

----------	---	------------

8.1.3 Sub block 0x01C2 – AWR_MONITOR_ANALOG_ENABLES_CONF_SB

This API SB contains the consolidated configuration of all analog monitoring. This is issued by the host to the AWR device.

The enabled monitoring functions are executed with a periodicity of CAL_MON_TIME_UNITS number of logical frames. The host should ensure that all the enabled monitors can be completed in the available inter-frame times, based on the monitoring durations (to be provided separately).

Table 8.3: AWR_MONITOR_ANALOG_ENABLES_CONF_SB contents

8.2 Temperature Monitor

This section contains API SBs that configure the on chip temperature monitors and report the soft results from the monitor. The corresponding monitors are collectively named TEMPERATURE_MONITOR. These monitors observe the temperature near various RF analog and digital modules using temperature sensors and GPADC and compare them against configurable thresholds. The report is sent as an async event [AWR_MONITOR_TEMPERATURE_REPORT_AE_SB](#).

8.2.1 Sub block 0x01C3 – AWR_MONITOR_TEMPERATURE_CONF_SB

This API is a monitoring configuration API which the host sends to the AWR device, containing information related to temperature monitoring. Report of this monitoring will be available in the async event [AWR_MONITOR_TEMPERATURE_REPORT_AE_SB](#).

8.3 RX Gain and Phase Monitor

This section contains API SBs that configure the monitors of receiver gain and phase. The corresponding monitors are collectively named RX_GAIN_PHASE_MONITOR. The report is sent as an async event [AWR_MONITOR_RX_GAIN_PHASE_REPORT_AE_SB](#).

NOTE:	<p>It is recommended for the user to configure this monitor in verbose mode (Mode 0), so that Host can compute actual RX gain through temperature compensation and detect presence of interference using Noise Power.</p> <p>In quiet mode, the user may consider programming broad thresholds for Absolute Gain Error, taking into account the temperature variation of reported RX_GAIN_VALUE.</p>
--------------	--

8.3.1 Sub block 0x01C4 – AWR_MONITOR_RX_GAIN_PHASE_CONF_SB

This is a monitoring configuration API which the host sends to the AWR device, containing information related to RX gain and phase monitoring.

Table 8.5: AWR_MONITOR_RX_GAIN_PHASE_CONF_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x01C4

8.7 TX Ball Break Monitor

This section contains API SBs that configure the monitors of transmitter balls and impedance matching. The corresponding monitors are collectively named TXn_BALLBREAK_MONITOR where n is the TX channel number.

TX ball break detection is performed through measurement of TX reflection coefficient's magnitude. The breakage of a TX ball is detected by observing high reflection magnitude.

8.7.1 Sub block 0x01CA – AWR_MONITOR_TX0_BALLBREAK_CONF_SB

This API is a monitoring configuration API which the host sends to the AWR device, containing information related to TX ball break detection.

This API SB controls the thresholds for the reflection coefficient magnitude check and the parameters for the reflection coefficient error distance check (variation from values at the time of factory calibration). The report is sent as an async event [AWR_MONITOR_TX0_BALLBREAK_REPORT_AE_SB](#).

Table 8.11: AWR_MONITOR_TX0_BALLBREAK_CONF_SB contents

8.8 TX Gain and Phase Mismatch Monitoring

This section contains API SBs that configure the monitors of transmitter gain and phase mismatches, and report the soft results from the monitor. The corresponding monitors are collectively named `TX_GAIN_PHASE_MISMATCH_MONITOR`.

This monitor needs the operation of at least one RX channel. It also needs to use the RX in complex mode. Therefore, if all channels are disabled as per `AWR_CHAN_CONF_SET_SB`, this monitor automatically enables one RX channel. Further, this monitor automatically uses both I and Q channels of the receiver, irrespective of the ADC settings given by `AWR_ADCOUT_CONF_SET_SB`.

8.8.1 Sub block 0x01CD – `AWR_MONITOR_TX_GAIN_PHASE_MISMATCH_CONF_SB`

This API is a monitoring configuration API which the host sends to the AWR device, containing information related to TX gain and phase mismatch monitoring. The report is sent as an async event `AWR_MONITOR_TX_GAIN_PHASE_REPORT_AE_SB`.

NOTE: Even when the TXs are matched, TX3 loopback path has gain and phase offsets wrt TX1 (and TX2), which get reported as mismatches in this API. These deterministic offsets can be compensated either through the OFFSET_VALUE fields (quiet mode) or through post processing by the host (verbose mode). Nominally, when the TXs are matched, TX3 - TX1 gain (i.e. loopback amplitude) is reported as -8dB. Nominally, when the TXs are matched, the reported TX3 - TX1 phase difference varies linearly with RF and it is reported as -5degree (76GHz) and 15degree (81GHz).

8.9 TX Phase Shifter Monitor

This section contains API SBs that configure the monitors of transmitter phase shifter and report the soft results from the monitor for various TX channels using TX loop-back. The corresponding monitors are collectively named TX0_PHASE_SHIFTER_MONITOR, TX1_PHASE_SHIFTER_

MONITOR and TX2_PHASE_SHIFTER_MONITOR for the respective TX channels.

The phase shifter monitor will report the measured phase values in order to enable calibration of phase shifter codes at HOST. It will report tone power amplitude to provide check for amplitude stability across phase shifter codes. It will also report noise power in order to detect the chirps affected by interference.

The maximum four phases can be monitored at a time in one FTTI interval for each TX, there is an option to increment the phase by PH_SHIFTER_INC_VAL to cover all 360° phase over the time.

NOTE: The absolute gain/phase values reported by PHASE_SHIFTER_MON can exhibit smooth drifts across monitoring intervals due to slow temperature drifts. The absolute phase/gain can also exhibit abrupt jumps across temperature calibration boundaries. One way to mitigate the effects of such jumps across monitoring intervals is to rely on relative gain/phase values within the same monitoring report (e.g. assign one of the 4 phase settings in the monitoring configuration as a reference phase setting).

8.9.1 Sub block 0x01CE – AWR_MONITOR_TX0_PHASE_SHIFTER_CONF_SB

This API is a monitoring configuration API which the host sends to the AWR device, containing information related to TX0 TX loop back based phase shifter monitoring.

The report is sent as an async event [AWR_MONITOR_TX0_PHASE_SHIFTER_REPORT_AE_SB](#).

8.10 Synthesizer Frequency Monitoring

This section contains API SBs that configure the monitors of synthesizer chirp frequency, and report the soft results from the monitor. The corresponding monitor is named SYNTH_FREQ_MONITOR.

8.10.1 Sub block 0x01D1 – AWR_MONITOR_SYNTHESIZER_FREQUENCY_CONF_SB

This API is a monitoring configuration API which the host sends to the AWR device, containing information related to synthesizer frequency monitoring during non functional chirps (non-live), the

live monitor during functional chirps can be used only for debug (only in master/single-chip mode). The report is sent as an async event [AWR_MONITOR_SYNTH_FREQUENCY_REPORT_AE_SB](#) for live monitor and [AWR_MONITOR_SYNTHESIZER_FREQUENCY_NONLIVE_REPORT_AE_SB](#) for nonlive monitor.

NOTE: The synth non-live mode monitor internally generates a test chirp based on the profile associated with it. In order to limit its execution time, if the profile's ramp time exceeds 60us, the test chirp's ramp time is limited to 60us and the chirp slope is scaled to cover the profile's intended RF bandwidth.

Table 8.18: AWR_MONITOR_SYNTHESIZER_FREQUENCY_CONF_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x01D1
SBLKLEN	2	Value = 16
PROFILE_INDX	1	This field indicates the Profile Index for which this monitoring configuration applies.
REPORTING_MODE	1	Value Definition 0 Report is sent every monitoring period without threshold check 1 Report is send only upon a failure (after checking for thresholds) 2 Report is sent every monitoring period with threshold check
FREQ_ERROR_THRESH	2	During the chirp, the error of the measured instantaneous chirp frequency w.r.t. the desired value is continuously compared against this threshold. The comparison result is part of the monitoring report message (Error bit is set if the measurement is above this threshold, ever during the previous monitoring period). 1 LSB = 10 kHz Valid range: 0 to 65535 (0 to 655MHz)
MONITOR_START_TIME	1	This field determines when the monitoring starts in each chirp relative to the start of the ramp. 1 LSB = 0.2 μ s, signed number Valid range: -25 to 25 μ s Recommended value: 6 μ s or above

MONITOR_CONFIG_MODE	1	<p>This field configures whether this monitor should be done for functional active chirps (mode 0) or non live monitor chirps. In case of non live monitor, the configuration needs to be sent twice for two VCOs (use mode 1 and 2).</p> <p>Value Definition</p> <p>0 LIVE_CONFIG (Debug Mode), The profile configuration for live mode is picked from this API, supported only in master/single-chip mode.</p> <p>1 VCO1_CONFIG, The profile configuration for Non-live mode is picked from this API for VCO1 monitor profile, supported in all modes (master, slave and single-chip).</p> <p>2 VCO2_CONFIG, The profile configuration for Non-live mode is picked from this API for VCO2 monitor profile, supported in all modes (master, slave and single-chip).</p> <p>Note: This feature is supported only on AWR2243 device.</p>
VCO_MON_EN	1	<p>This bit mask can be used to enable/disable the monitoring of non-live VCO profiles, this helps to control monitoring of only single VCO if needed. This setting should be same in both VCO settings.</p> <p>bits Definition</p> <p>b0 Enable VCO1 non-live monitor</p> <p>b1 Enable VCO2 non-live monitor</p> <p>b31:2 RESERVED</p>
RESERVED	1	0x000000
RESERVED	4	0x00000000

NOTE1:	(Live mode) It is recommended to re-issue this configuration API each time before enabling this monitor and frame trigger. The right sequence is as below: <ol style="list-style-type: none">1. Issue Synth frequency monitor configuration API.2. Enable Synth frequency monitor.3. Frame start.4. Frame stop.5. Frame start. (Optional in case of multiple frames)6. Frame stop. (Optional in case of multiple frames)7. Disable Synth frequency monitor (in case disabled for some reason)8. Issue Synth frequency monitor configuration API.9. Enable Synth frequency monitor.10. Frame start.
NOTE2:	In non live mode, this API can be issued twice with <code>MONITOR_CONFIG_MODE</code> value set to 1 and 2 respectively for two different VCOs configured in two different profiles. The consolidated report for two VCOs in non-live mode is sent in a separate AE AWR_MONITOR_SYNTHESIZER_FREQUENCY_NONLIVE_REPORT_AE_SB
NOTE3:	In non live mode, the reporting mode and <code>VCO_MON_EN</code> for two VCO configurations should be same.

8.11 External Analog Signals Monitor

This section contains API SBs that configure the monitors of external analog signals which are input to the device through pins `ANALOGTEST1-4`, `ANAMUX` and `VSENSE` (also called `ADC1-6`) and report the soft results from the monitor. The corresponding monitors are collectively named `EXTERNAL_ANALOG_SIGNALS_MONITOR`. These monitors observe various analog signals input on the pins `ADC1-6` using a `GPADC` and compare them against internally fixed thresholds.

8.11.1 Sub block 0x01D2 – `AWR_MONITORING_EXTERNAL_ANALOG_SIGNALS_CONF_SB`

This API is a monitoring configuration API which the host sends to the AWR device, containing information related to external DC signals monitoring (available only in `xWR1642/xWR6843/xWR1843`). The report is sent as an async event [AWR_MONITOR_EXTERNAL_ANALOG_SIGNALSREPORT_AE_SB](#).

Table [8.19](#) describes the content of this sub block.

Table 8.19: AWR_MONITOR_EXTERNAL_ANALOG_SIGNALS_CONF_SB

8.12 Internal Analog Signals Monitor

This section contains API SBs that configure the monitors of internal analog signals in the RF analog modules and report the soft results from the monitor. The corresponding monitors are collectively named INTERNAL_ANALOG_SIGNALS_MONITOR. These monitors observe various analog nodes in the RF and analog modules using a GPADC and compare them against internally fixed thresholds.

The configuration API SBs are organized to address various analog circuits as follows:

1. TX0 Internal Analog Signals Monitoring
 - a. This monitor is called INTERNAL_TX0_SIGNALS_MONITOR.
 - b. Signal sets that are monitored: (SUPPLY_TX, PWRDET_TX)
2. TX1 Internal Analog Signals Monitoring

- a. This monitor is called INTERNAL_TX1_SIGNALS_MONITOR
 - b. Signal sets that are monitored: (SUPPLY_TX, PWRDET_TX)
3. TX2 Internal Analog Signals Monitoring
 - a. This monitor is called INTERNAL_TX2_SIGNALS_MONITOR
 - b. Signal sets that are monitored: (SUPPLY_TX, PWRDET_TX)
 4. RX Internal Analog Signals Monitoring
 - a. This monitor is called INTERNAL_RX_SIGNALS_MONITOR
 - b. Signal sets that are monitored: (SUPPLY_RX, PWRDET_RX, DCBIAS_RX)
 5. PM CLK LO Internal Analog Signals Monitoring
 - a. This monitor is called INTERNAL_PMCLKLO_SIGNALS_MONITOR
 - b. Signal sets that are monitored: (SUPPLY_PMCLKLO, PWRDET_PMCLKLO, DCBIAS_PMCLKLO)
 6. GPADC Internal Analog Signals Monitoring
 - a. This monitor is called INTERNAL_GPADC_SIGNALS_MONITOR
 - b. Signal sets that are monitored: (GPADC_REF1, GPADC_REF2)

The results are reported in the corresponding REPORT API SBs in this section.

8.12.1 Sub block 0x01D3 – AWR_MONITOR_TX0_INTERNAL_ANALOG_SIGNALS_CONF_SB

This API is a monitoring configuration API which the host sends to the AWR device, containing information related to TX0 Internal Analog Signals monitoring including Tx Phase shifter DAC monitor. The report is sent as an async event [AWR_MONITOR_TX0_INTERNAL_ANALOG_SIGNALS_REPORT_AE_SB](#).

8.12.6 Sub block 0x01D8 – AWR_MONITOR_GPADC_INTERNAL_ANALOG_SIGNALS_CONF_SB

This API is a monitoring configuration API which the host sends to the AWR device, containing information related to GPADC Internal Analog Signals monitoring. During this monitor, only the relevant circuits are ensured to be ON. The monitored signals are compared against internally chosen valid limits. The comparison result is part of the consolidated monitoring report message (Error bit for any signal set is set to 1 if any measurement in that signal set is beyond valid limits). The report is sent as an async event [AWR_MONITOR_GPADC_INTERNAL_ANALOG_SIGNALS_REPORT_AE_SB](#).

Table 8.25: AWR_MONITOR_GPADC_INTERNAL_ANALOG_SIGNALS_CONF_SB contents

8.13 PLL Control Voltage Monitor

This section contains API SBs that configure the monitors of APLL and Synthesizer VCO control voltages and report the soft results from the monitor. The corresponding monitors are collectively named PLL_CONTROL_VOLTAGE_MONITOR. These monitors observe the VCO control voltages under various conditions using the GPADC and compare them against internally fixed thresholds. The transmitters are kept in OFF state during these measurements to avoid external emission.

8.13.1 Sub block 0x01D9 – AWR_MONITOR_PLL_CONTROL_VOLTAGE_SIGNALS_CONF_SB

This is a monitoring configuration API which the host sends to the AWR device, containing information related to APLL and Synthesizer's control voltage signals monitoring. The report is sent as an async event [AWR_MONITOR_PLL_CONTROL_VOLTAGE_REPORT_AE_SB](#).

Table 8.26: AWR_MONITOR_PLL_CONTROL_VOLTAGE_CONF_SB contents

SIGNAL_EN- ABLES	2	<p>This field indicates the sets of signals which are to be monitored. When each bit in this field is set, the corresponding signal set is monitored using test chirps. Rest of the RF analog may not be ON during these test chirps. The APLL VCO control voltage can be monitored. The Synthesizer VCO control voltage for both VCO1 and VCO2 can be monitored, while operating at their respective minimum and maximum frequencies, and their respective VCO slope (Hz/V) can be monitored if both frequencies are enabled for that VCO. The monitored signals are compared against internally chosen valid limits. The comparison results are part of the monitoring report message.</p> <p>Bit Location SIGNAL b0 APLL_VCTRL b1 SYNTH_VCO1_VCTRL b2 SYNTH_VCO2_VCTRL b15:3 RESERVED The synthesizer VCO extreme frequencies are: Synthesizer VCO Frequency Limits (Min, Max) VCO1 (76GHz, 78GHz) VCO2 (77GHz, 81GHz) Synthesizer measurements are done with TX switched off to avoid emissions.</p>
RESERVED	4	0x00000000

8.14 Dual Clock Comparator Based Clock Frequency Monitor

This section contains API SBs that configure the Dual Clock Comparator based monitors of clocks in the BSS digital modules and report the soft results from the monitor. The corresponding monitors are collectively named DCC_CLOCK_FREQ_MONITOR. These monitors observe the relative frequency of various clock pairs and compare the measured relative frequency errors against internally fixed thresholds.

The various clock pairs that are monitored are defined here:

CLOCK PAIR	REFERENCE CLOCK	MEASURED CLOCK	ERROR THRESH-OLD (Tentative)
------------	-----------------	----------------	------------------------------

0	XTAL	BSS_600M	±1.0%
1	BSS_600M	BSS_200M	±1.0%
2	BSS_600M	BSS_100M	±1.0%
3	BSS_600M	GPADC_10M	±2.5%
4	BSS_600M	RCOSC_10M	±30.0%

The ideal frequencies of clocks involved in this monitor are given here:

Table 8.27: DCC Clock monitor pairs

CLOCK NAME	CLOCK FREQUENCY (MHz)	COMMENTS
XTAL	40	Crystal clock

8.15 RX Saturation Detection Monitor

This section contains API SBs that configure the monitoring of RX analog saturation detectors, and report the results from the monitor. The corresponding monitors are collectively named RX_SATURATION_DETECTOR_MONITOR and RX_SIG_IMG_BAND_MONITOR. The report is available in CQ RAM.

8.15.1 Sub block 0x01DB – AWR_MONITOR_RX_SATURATION_DETECTOR_CONF_SB

This API is a monitoring configuration API which the host sends to the mmWave device, containing information related to RX saturation detector monitoring. The report is available as CQ2 (part of CQ) in CQ RAM every chirp. The application should transfer the report from CQ RAM every chirp.

Table 8.29: AWR_MONITOR_RX_SATURATION_DETECTOR_CONF_SB
 contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x01DB
SBLKLEN	2	Value = 24
PROFILE_INDX	1	This field indicates the profile index for which this monitoring configuration applies.
SAT_MON_SELECT	1	01 – Enable only the ADC saturation monitor 11 – Enable both the ADC and IFA1 saturation monitors
RESERVED	1	0x00
RESERVED	1	0x00
SAT_MON_PRIMARY_TIME_SLICE_DURATION	2	<p>It specifies the duration of each (primary) time slice. 1 LSB = 0.16 μs. Valid range: 4 to floor(ADC sampling time us/0.16 μs)</p> <p>NOTES: The minimum allowed duration of each (primary) time slice is 4 LSBs = 0.64 μs. Also, the maximum number of (primary) time slices that will be monitored in a chirp is 64 so the recommendation is to set this value to correspond to (ADC sampling time / 64). If the slice is smaller, such that the ADC sampling time is longer than 64 primary slices, some regions of the valid duration of a chirp may go un-monitored.</p>

Continued on next page

Table 8.29 – continued from previous page

SAT_MON_NUM_SLICES (N)	2	<p>Number of (primary + secondary) time slices to monitor. Valid range: 1 to 127</p> <p>NOTE1: Together with SAT_MON_PRIMARY_TIME_SLICE_DURATION, this determines the full duration of the ADC valid time that gets covered by the monitor. Primary slices = $(N+1) / 2$ Secondary slices = Primary slices - 1</p> <p>NOTE2:The total monitoring duration is recommended to be programmed slightly smaller than ADC sampling time to avoid last primary slice miss in the CQ data. If this recommendation is not followed and if ADC sampling time is less than total requested monitoring duration then no error is generated but the total number of slices reported back in CQ buffer would be a different value M, which is less than user requested value of N. In such cases, there will be $(M+1)/2$ primary slices and $(M-1)/2$ secondary slices. However, if ADC sampling time is such that Secondary $(M-1)/2$ can be measured and not Primary $(M+1)/2$, then primary slice $(M+1)/2$ will not be present in the CQ buffer. In such scenario, CQ buffer will have the total number of slices reported back as M-1 instead of M.</p>
SAT_MON_RX_CHANNEL_MASK	1	<p>Masks RX channels used for monitoring. In every slice, saturation counts for all unmasked channels are added together, and the total is capped to 127.</p> <p>The 8 bits are mapped (MSB->LSB) to: [RX3Q, RX2Q, RX1Q, RX0Q, RX3I, RX2I, RX1I, RX0I] 00000000 – All channels unmasked 11111111 – All channels masked</p>

8.15.2 Sub block 0x01DC – AWR_MONITOR_SIG_IMG_MONITOR_CONF_SB

This API is a monitoring configuration API which the host sends to the mmWave device, containing information related to signal and image band energy. The report is available as CQ1 (part of CQ) in CQ RAM. The application should transfer the report every chirp.

Table 8.30: AWR_MONITOR_RX_SIG_IMG_MONITOR_CONF_SB contents

Field Name	Number of bytes	Description
SBLKID	2	Value = 0x01DC
SBLKLEN	2	Value = 16
PROFILE_INDX	1	This field indicates the profile index for which this monitoring configuration applies.
SIG_IMG_MON_NUM_SLICES	1	Number of (primary + secondary) slices to monitor Valid range: 1 to 127
NUM_SAMPLES_PER_PRIMARY_TIME_SLICE	2	This field specifies the number of samples constituting each time slice. The minimum allowed value for this parameter is 4. Valid range: 4 to NUM_ADC_SAMPLES (see NOTE2 below) NOTE1: The maximum number of (primary) time slices that will be monitored in a chirp is 64, so our recommendation is that this value should at least equal (NUM_ADC_SAMPLES / 64). If the slice is smaller, such that the number of ADC samples per chirp is larger than 64 primary slices, some regions of the valid duration of a chirp may go un-monitored. NOTE2: In Complex1x mode, the minimum number of samples per slice is 4 and for other modes it is 8. Also note that number of samples should be an even number. NOTE3: The total monitoring duration is recommended to program slightly smaller than ADC sampling time
RESERVED	4	0x00000000
RESERVED	4	0x00000000

NOTE: It is recommended to re-issue these rx saturation and/or signal image monitor configuration APIs each time before enabling these monitor and frame trigger. The right sequence is as below:

1. Issue rx saturation and/or signal image monitor configuration API.
2. Enable rx saturation and/or signal image monitor.
3. Frame start.
4. Frame stop.
5. Frame start. (Optional in case of multiple frames)
6. Frame stop. (Optional in case of multiple frames)
7. Disable rx saturation and/or signal image monitor (in case disabled for some reason)
8. Issue rx saturation and/or signal image monitor configuration API.
9. Enable rx saturation and/or signal image monitor.
10. Frame start.

8.16 RX mixer input power monitor

8.16.1 Sub block 0x01DD – AWR_MONITOR_RX_MIXER_IN_POWER_CONF_SB

This API is a monitoring configuration API which the host sends to the AWR device, containing information related to RX mixer input power monitoring. The report is sent as an async event [AWR_MONITOR_RX_MIXER_IN_POWER_REPORT_AE_SB](#).

NOTE: The RX input power monitor API is debug only API. Please refer latest DFP release note for more info.

8.18 Analog Fault injection

8.18.1 Sub block 0x01DF – AWR_ANALOG_FAULT_INJECTION_CONF_SB

This API is a fault injection API which the host sends to the AWR device. It can be used to inject faults in the analog circuits to test the corresponding monitors. After the faults are injected, the regular enabled monitors will indicate the faults in their associated reports.

NOTE1:	This API should be issued when no frames are on-going.
NOTE2:	The fault injection should be tested by injecting one fault at a time and corresponding analog monitor should be observed, other monitors might show failure depending on type of fault, it can be discarded.
NOTE3:	It is recommended to perform device reset after enabling fault injection before moving to functional mode.
NOTE4:	Some of the fault injection options are de-featured, please refer latest DFP release note for more details.
NOTE5:	Disable all runtime calibrations while Fault is injected.

Figure 10.1: Chirp parameter information fields

	31	23	16	15	8	7	0
DSS_REG_VBUSM.CH0CPREG0	Byte 3	Byte 2	Byte 1	Byte 1	Byte 0	Byte 0	Byte 0
DSS_REG_VBUSM.CH0CPREG1	Byte 7	Byte 6	Byte 5	Byte 5	Byte 4	Byte 4	Byte 4
DSS_REG_VBUSM.CH0CPREG2	Byte 11	Byte 10	Byte 9	Byte 9	Byte 8	Byte 8	Byte 8
DSS_REG_VBUSM.CH0CPREG3	Byte 15	Byte 14	Byte 13	Byte 13	Byte 12	Byte 12	Byte 12

Figure 10.2: Chirp parameter information from DSS registers

For multichip use case, the CP data is available for up to 8 chirps in DSS_REG_VBUSM.CH[0-7]CPREG[0-3].

10.2 Chirp Quality data

Chirp quality information is divided into 3 parts

1. CQ0 – Wideband signal and image energy information (Reserved for future use)
2. CQ1 – RX signal and image band energy statistics
3. CQ2 – RX ADC and IF saturation information

CQ data will be available in CQ RAM which is a ping-pong memory when the CQ monitors are enabled. Currently supported CQ monitors are AWR_MONITOR_RX_SATURATION_DETECTOR_CONF_SB for CQ2 and AWR_MONITOR_SIG_IMG_MONITOR_CONF_SB for CQ1. CQ data will be refreshed every chirp by the hardware. User has to ensure that before the next chirp finishes, the current chirps' CQ data is either processed or transferred to a local memory for further processing.

NOTE: CQ0 is not supported by firmware currently, but the CQ RAM will be updated for CQ0 data. Maximum size of CQ0 data is 256 bytes. Users should ignore the CQ RAM for CQ0.

The starting location (on 128 bit boundary) of each CQ data within the CQ memory can be configured by programming DSS_REG.CQCFG1[12:4] for CQ0, DSS_REG.CQCFG1[21:13] for CQ1 and DSS_REG.CQCFG1[30:22] for CQ2.

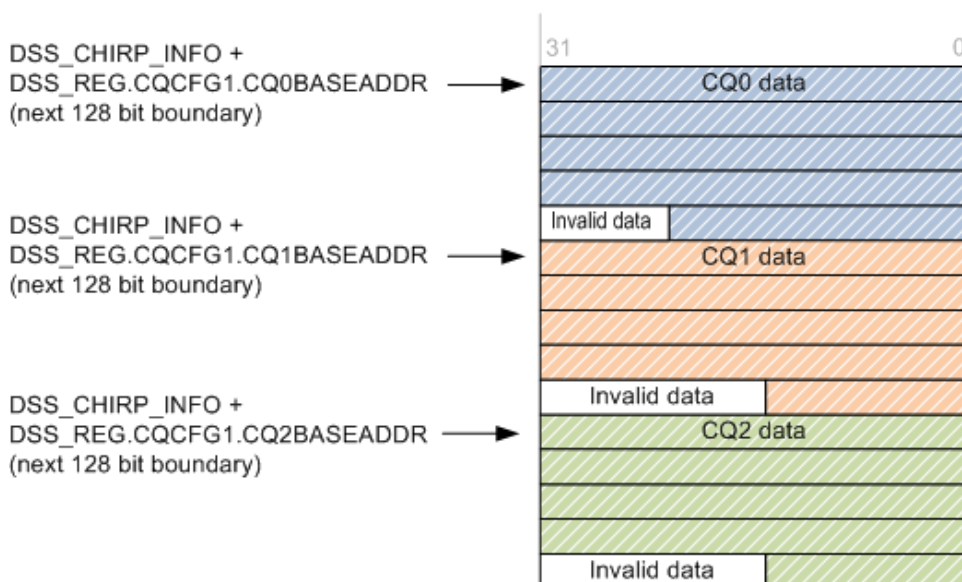

Figure 10.3: CQ data start address configuration in single chirp use case

For N-chirp use case, when user wishes to process N chirps simultaneously, then CQ0 for all N chirps will be concatenated together in memory. Similarly CQ1 and CQ2 for all N chirps will also be concatenated together.

NOTE: When CQ data is concatenated in N-chirp use case, the CQ data for new chirp starts on the next 128 bit boundary.

Figure 10.4: CQ data start address configuration in multi chirp use case

The `CQDATAWIDTH` parameter in `DSS_REG.CQCFG1` defines the packing of the CQ data in the CQ memory in either 16-bit mode, 12-bit mode or in 14-bit mode.

10.2.1 CQ1

The signal band and image band are separated using a two-channel filter bank and the ADC sampling time duration is monitored in terms of primary and secondary time slices, as shown below.

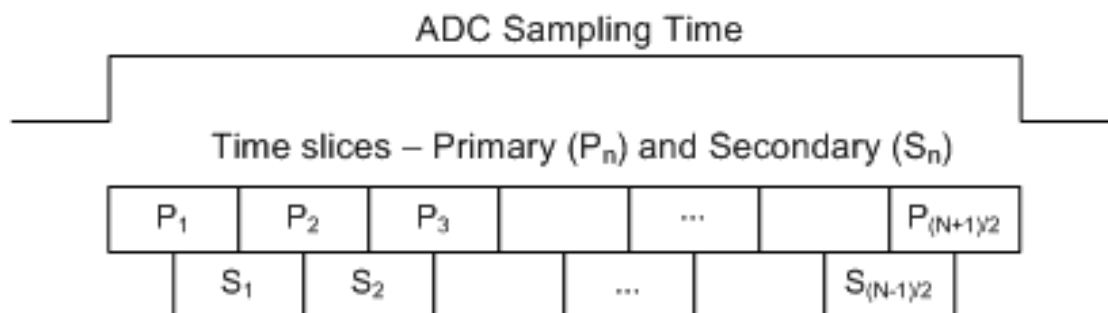

Figure 10.5: Time slices during RX signal and image band monitor and saturation monitor

For each of the two bands (signal and image), for each time slice, the input-referred average power in the slice in negative dBm is recorded as an 8-bit unsigned number, with 1 LSB = -0.5 dBm

CQ1 data is stored in memory as shown below (in 16-bit mode)

Figure 10.6: CQ1 data format in memory in 16-bit mode

N indicates the total number of primary and secondary slices which are monitored (maximum value of N is 127). P_{s,i_n} indicates the power of primary slice n for {signal, image} band and S_{s,i_n} indicates the power of secondary slice n for {signal, image} band. Each power is encoded in 8 bit unsigned number with each LSB representing -0.5 dBm.

Since maximum value of N is 127, the maximum size of CQ1 data in 16-bit mode is 256 bytes

NOTE: In real output mode, since there is no image band visibility, only the signal band statistics will be meaningful.

Similarly, in 12-bit and 14-bit modes, the CQ1 data in CQ memory will be packed as shown below. Only the relevant bits in each 16 bits of memory (either 12 bits or 14 bits) are useful and other bits are not written by hardware.

Figure 10.7: CQ1 data format in memory in 12-bit mode

Figure 10.8: CQ1 data format in memory in 14-bit mode

10.2.2 CQ2

The analog to digital interface includes a 100 MHz bit stream indicating saturation events in the ADC/IF sections, for each channel. This one-bit indicator for each channel is monitored during the ADC sampling time duration in a time-sliced manner, as shown in Figure 10.5.

For each time slice, a saturation event count is recorded. This count is the sum of saturation event counts across all RX channels selected for monitoring, capped to a maximum count of 255 (8 bits). The saturation counts are stored in memory as shown below

Figure 10.9: CQ2 data format in memory in 16-bit mode

N indicates the total number of primary and secondary slices which are monitored (maximum value of N is 127). P_n indicates the accumulated saturation count for all enabled RX channels in primary slice n, S_n indicates the accumulated saturation count for all enabled RX channels in secondary slice n.

Since maximum value of N is 127, the maximum size of CQ2 data in 16-bit mode is 128 bytes. Similarly, in 12-bit and 14-bit modes, the CQ2 data in CQ memory will be packed as shown below. Only the relevant bits in each 16 bits of memory (either 12 bits or 14 bits) are useful and other bits are not written by hardware.

Figure 10.10: CQ2 data format in memory in 12-bit mode

Figure 10.11: CQ2 data format in memory in 14-bit mode

11 Chirp, Burst and Frame timings

AWR2243 and xWR6843 device minimum chirp cycle time, inter-burst time, inter sub-frame/frame time requirements are documented in this section.

11.1 Chirp Cycle Time

Table 11.1: Minimum chirp cycle time

Use case	Min Chirp cycle time (μs)	Description
Typical chirps	13	The normal chirps used in a burst or a frame using legacy chirp configuration API
Advance chirps	25	The advance chirps used in a burst or a frame using advanced chirp configuration API
Advance chirp (Continuous framing mode)	30	A single advance chirp used in a burst using advanced chirp configuration API. Continuous framing mode is a mode in which a single chirp is programmed in a burst using advanced frame configuration API.

11.2 Minimum Inter Burst Time

Table 11.2: Minimum inter burst time

Min inter burst time	Time (μ s)	Description
Typical inter burst time	55	The minimum inter burst idle time required in normal bursts with legacy chirps configured in a advanced frame configuration API with inter burst power save disabled.
Inter burst power save time	55	Add inter burst power save time to minimum inter burst time if it is enabled. By default inter-burst power save is enabled, it can be disabled using AWR_RF_DEVICE_CFG_SB API
Inter chirp power save override time (power save disable)	15	Add inter chirp power save override time to minimum inter burst time if chirp idle time < 10us in a burst or can be controlled using AWR_DYNAMICPOWERSAVE_CONF_SET_SB API
Advance chirp configuration time	45	Add advance chirp configuration time to minimum inter burst time if advance chirp configuration is enabled in AWR_RF_RADAR_MISC_CTL_SB API
Advance chirp configuration time (Continuous framing mode)	20	Add Continuous framing mode advance chirp configuration time to minimum inter burst time if advance chirp configuration is enabled in AWR_RF_RADAR_MISC_CTL_SB API. Continuous framing mode is a mode in which a single chirp is programmed in a burst using advanced frame configuration API.
Calibration or Monitoring chirp time	145	Add calibration or Monitoring chirp time to minimum inter burst time if calibration or monitors intended to be run in inter burst idle time. The calibration and monitoring chirps can run only in inter sub-frame or inter-frame interval if this time is not allocated in inter-burst time. Add calibration or Monitoring duration to minimum inter burst or sub-frame/frame time based on Table 12.2 and Table 12.4

11.3 Minimum Inter Sub-frame or Frame Time

Table 11.3: Minimum inter sub-frame/frame time

Min inter sub-frame/frame time	Time (μs)	Description
Typical inter sub-frame/frame time	300	The minimum inter sub-frame/frame idle time required in normal sub-frames with legacy chirps configured in a advanced frame configuration API or in a legacy frame config API. This time includes time required for minimum inter-burst idle time, inter burst power save, inter chirp power save override and single calibration/monitoring chirp time.
Advance chirp configuration time	45	Add advance chirp configuration time to minimum inter sub-frame/frame time if advance chirp configuration is enabled in AWR_RF_RADAR_MISC_CTL_SB API
Calibration or Monitoring duration	Table 12.2 and Table 12.4	Add calibration or Monitoring duration to minimum inter sub-frame/frame time based on Table 12.2 and Table 12.4
Loop-back burst configuration time	300	Add Loop-back burst configuration time to minimum inter sub-frame time for loop back sub-frames if it is enabled in advance frame config API.
Dynamic legacy chirp configuration time (for 16 chirps)	20	Add dynamic legacy chirp configuration time to minimum inter frame time if dynamic chirp/phase-shifter APIs are issued in runtime.
Dynamic advance chirp configuration time (without LUT)	20	Add dynamic advance chirp configuration time to minimum inter frame time if dynamic advance chirp API is issued in runtime. The dynamic update of advance chirp generic LUT is done immediately when the API is received at BSS and there is no impact to inter frame time, however user has to take care of timing of the LUT update as it should not corrupt the ongoing chirp configuration.
Dynamic profile configuration time (for 1 profile)	700	Add dynamic profile configuration time to minimum inter frame time if dynamic profile API is issued in runtime.

12 Calibration and monitoring durations

12.1 Boot time calibration durations

AWR2243 device boot time calibration duration is as below:

Table 12.1: Duration of boot time calibrations for AWR2243 device

Sl. No.	Calibration	Duration (μ s)
1	APLL	330
2	Synth VCO	1400
3	LO DIST	800
4	ADC DC	600
5	HPF cutoff	3500
6	LPF cut off	200
7	Peak detector	7000
8	TX power (for each TX)	2000
9	RX gain	1500
10	TX phase (for each TX)	12 000
11	RX IQMM	42 000

12.2 Run time calibration durations

AWR2243 run time calibration durations captured in Table 12.2. Note that the firmware performs calibrations in small chunks of 145 μ s. User has to ensure that the total idle time in one CAL_MON_TIME_UNIT is sufficient to fit the enabled calibrations.

Table 12.2: Duration of run time calibrations for AWR2243 devices

Sl. No.	Calibration	Duration (μ s)
1	APLL	150
2	Synth VCO	350
3	LO DIST	30
4	Peak detector	600
5	TX power CLPC (for each TX and for 1 profile)	800
6	TX power OLPC (In case CLPC is disabled)	30
6	RX gain	30
7	Application of calibration to hardware (This needs to be included always)	100

To configure CALIB_MON_TIME_UNIT, user has to calculate the total available IDLE time in the frame and please refer Table 11.2 for the same. The duration for all the enabled calibrations should be included and following software overheads should be added to that number

12.3 Monitoring duration

Table 12.3 lists the duration of all analog monitors and Table 12.4 lists the duration of all digital monitors

Table 12.3: Duration of analog monitors for AWR2243 device

Sl. No.	Monitors	Duration (μ s)
1	RX gain phase (assumes 1 RF frequency)	1250
2	RX noise figure (assumes 1 RF frequency)	300
3	RX IF stage (assumes 1 RF frequency)	1400
4	TX power (assumes 1 TX, 1 RF frequency)	250
5	TX ballbreak (assumes 1 TX)	300
6	TX gain phase mismatch (assumes 1 TX, 1 RF frequency)	400
7	TX phase shifter (assumes 1 TX and 1 phase)	300
8	Synthesizer frequency Live	100
9	External analog signals (all 6 GPADC channels enabled)	150
10	TX Internal analog signals and PS DAC (assumes 1 TX)	2400
11	RX internal analog signals	1800
12	PMCLKLO internal analog signals and 20G Sync	550
13	GPADC internal signals	50
14	PLL control voltage	300
15	Dual clock comparator (assumes 6 clock comparators)	110
16	RX saturation detector	100
17	RX signal and image band monitor	100
18	RX mixer input power	700
19	Temperature monitor	200
20	Synthesizer frequency Non-live monitor	500

Table 12.4: Duration of digital monitors for AWR2243 device

Sl. No.	Monitors	Duration (μ s)
1	Periodic configuration register readback	70
2	DFE LBIST monitoring	1000
3	Frame timing monitoring	10

12.4 Software overheads

When the calibrations or monitorings are enabled, the software needs certain time for reading the temperature sensors, reading the DFE statistics, preparing the calibration or monitoring reports and to clear the watchdog (WDT). All these time durations should also be accounted when computing the CALIB_MON_TIME_UNIT. The details of the software overheads are given in the Table 12.5

Table 12.5: Software overheads every FTTI that should be accounted to program CALIB_MON_TIME_UNIT and CALIBRATION_PERIODICITY

Sl. No.	Software overhead	Duration (μ s)
1	Periodic monitoring of stack usage	20
2	Minimum monitoring duration (report formation, digital energy monitor at the end of FTTI, temperature read every FTTI)	1000
3	Minimum calibration duration (report formation, temperature read every CAL_MON_TIME_UNIT)+	500
4	Idle time needed per FTTI for windowed watchdog (WDT)	$\text{Frame period} \times \text{CALIB_MON_TIME_UNIT}/8$ i.e. $\sim 12.5\%$ of $\text{Frame period} \times \text{CALIB_MON_TIME_UNIT}$ is reserved for watchdog clearing time

12.4.1 Note on idle time for clearing the watchdog (WDT)

The clearing window of the watchdog is 12.5% of total FTTI as shown in the figure below. One FTTI can have multiple frames in legacy frame configuration or in advanced frame configuration - each frame can have multiple sub-frames and each sub-frame can have multiple bursts.

The required idle time for clearing watchdog is absolute 12.5% of the overall FTTI interval, this 12.5% clearing window can have multiple frames or subframes or bursts. The granularity of the required watchdog idle time calculation is limited to sub-frame period.

Example

A user has enabled advanced frame configuration where each frame consists of 3 sub-frames and each sub-frame is of 5 ms duration. FTTI is configured as 25 frames. Each sub-frame contains 100 chirps, each chirp consisting of 4 μ s idle time and 21 μ s ramp time. i.e. duty cycle is 50%. The watchdog clearing window and time for calibration and monitoring is calculated as follows

Figure 12.1: Watchdog idle time calculation

Frame duty cycle	=	50	%
Idle time per frame (50% of 15 ms)	=	7.5	ms
FTTI (15 ms × 25 frames)	=	375	ms
Available idle time per FTTI (50% of 375 ms)	=	187.5	ms
Ideal watchdog clearing window (12.5% of 375 ms)	=	46.875	ms
The calculated watchdog clearing window in firmware is as follows			
Duration of complete frames which can be fit in watchdog clearing window ($\lceil 46.875/15 \rceil \times 15$)	=	45	ms
Fractional watchdog clearing time (which will be fit in the sub-frame idle time) ($46.875 - (15 \times 3)$)	=	1.875	ms
Time available for calibration/monitoring per FTTI (21 frames × 7.5 ms) + (2 sub-frames × 2.5 ms) + 0.625 ms	=	163.125	ms

The following examples show how the user can budget for calibration and monitoring time and configure the FTTI correctly.

Example 1

A user has enabled 2 TX, uses only 1 profile, frame configuration consists of 64 chirps, each chirp is of duration is 66 μ s (56 μ s ramp time and 10 μ s chirp idle time) and frame periodicity is 10 ms. User has enabled all run time calibrations. None of the analog monitoring is enabled.

Frame duty cycle	= 42.24%
Idle time per frame (57.76% of 10 ms)	= 5.776 ms
Idle time available for calibration/monitoring per frame (100 μ s is for frame preparation)	} = 5.676 ms
Time needed for all run time calibrations.....	} = 2760 μ s
150 + 300 + 30 + 500 + (800 \times 2) + 30 + 150	} = 2770 μ s
Minimum time for software overheads.....	} = 2770 μ s
20 + 1000 + 500 + (10000 \times 1/8)	} = 5530 μ s
Total time needed per frame for calibration	} = 5530 μ s
2760 μ s + 2770 μ s	

Total time needed per frame for calibration is 5.530 μ s which is less than the frame idle time (5.676 ms) and hence this configuration will be honored by the MMIC device.

User can set CALIB_MON_TIME_UNIT to 1 and CALIBRATION_PERIODICITY as 100. With this setting calibrations are triggered once every 100 frames (i.e. once every 1 s)

Example 2

Consider another example where the frame configuration remains the same as in example 1, but frame periodicity is reduced to 8 ms.

Frame duty cycle	= 52.80%
Idle time per frame (47.20% of 8 ms)	= 3.776 ms
Idle time available for calibration/monitoring per frame (100 μ s is for frame preparation)	} = 3.676 ms
Time needed for all run time calibrations.....	} = 2760 μ s
150 + 300 + 30 + 500 + (800 \times 2) + 30 + 150	} = 2760 μ s
Minimum time for software overheads.....	} = 2520 μ s
20 + 1000 + 500 + (8000 \times 1/8)	} = 2520 μ s
Total time needed per frame for calibration	} = 5280 μ s
2760 μ s + 2520 μ s	} = 5280 μ s

Total time needed per frame for calibration is 5.280 μ s which is more than the frame idle time (3.676 ms) and hence this configuration will **not** be honored by the MMIC device.

User can set CALIB_MON_TIME_UNIT to 2 and CALIBRATION_PERIODICITY as 63. With this setting calibrations are triggered once every 126 frames (i.e. once every 1.008 s)

Example 3

A user has enabled 2 TX, uses 2 profiles, frame configuration consists of 32 chirps, each chirp is of duration is 90 μs (80 μs ramp time and 10 μs chirp idle time) and frame periodicity is 6 ms. User has enabled all run time calibrations. None of the analog monitoring is enabled.

Frame duty cycle	= 48.00%
Idle time per frame (52.00% of 6 ms)	= 3.120 ms
Idle time available for calibration/monitoring per frame (100 μs is for frame preparation)	= 3.020 ms
Time needed for all run time calibrations.....	} = 4360 μs
150 + 300 + 30 + 500 + (800 \times 2 \times 2) + 30 + 150	
Minimum time for software overheads.....	} = 2270 μs
20 + 1000 + 500 + (6000 \times 1/8)	
Total time needed per frame for calibration 4360 μs + 2270 μs	= 6630 μs

Total time needed per frame for calibration is 6.630 μs which is more than the frame idle time (3.020 ms) and hence this configuration will **not** be honored by the MMIC device.

User can set CALIB_MON_TIME_UNIT to 3 and CALIBRATION_PERIODICITY as 56. With this setting, minimum required time is 8.13 ms and available idle time for calibration/monitoring is 9.06 ms and calibrations are triggered once every 168 frames (i.e. once every 1.008 s)

Example 4

A user has enabled 2 TX, uses 2 profiles, frame configuration consists of 32 chirps, each chirp is of duration is 90 μ s (80 μ s ramp time and 10 μ s chirp idle time) and frame periodicity is 6 ms. User has enabled all run time calibrations. Analog monitorings which are enabled are (a) TX output power monitor for TX0 and TX1 (b) TX BPM monitor for TX0 and TX1 (c) RX gain phase monitor and (d) RX noise figure monitor. Each of the monitors are configured to be run for 1 profile and 3 RF frequencies (low, mid and high) as defined by the profile.

Frame duty cycle	= 48.00%
Idle time per frame (52.00% of 6 ms)	= 3.120 ms
Idle time available for calibration/monitoring per frame (100 μ s is for frame preparation)	= 3.020 ms
Time needed for all run time calibrations.....	= 4360 μ s
150 + 300 + 30 + 500 + (800 \times 2 \times 2) + 30 + 150	
Time needed for all monitoring.....	= 6850 μ s
(1250 \times 3) + (250 \times 3) + (200 \times 3 \times 2) + (575 \times 2)	
Minimum time for software overheads.....	= 2270 μ s
20 + 1000 + 500 + (6000 \times 1/8)	
Total time needed per frame for calibration and monitoring	= 13480 μ s
4360 μ s + 6850 μ s + 2270 μ s	

Total time needed per frame for calibration is 13.480 μ s which is more than the frame idle time (3.020 ms) and hence this configuration will **not** be honored by the MMIC device.

User can set CALIB_MON_TIME_UNIT to 6 and CALIBRATION_PERIODICITY as 28. With this setting, minimum required time for calibration and monitoring is 16.48 ms and available idle time for calibration/monitoring is 18.72 ms. Monitoring is triggered once in 6 frames and calibration is triggered once in 168 frames (i.e. once every 1.008 s)

12.5 Sample Application

For sample application please refer DFP (device firmware package) user guide document.
 2243CHANGES

Appendices

A AWR2243 API changes

The Scope of this section is to highlight the new APIs and changes to existing APIs w.r.t. AWR1243 device APIs, all the features/APIs of AWR1243 are supported and applicable to AWR2243 (Backward Compatible) in addition to new APIs unless otherwise it is explicitly captured below. Please refer mmWaveLink driver migration guide document for more info for API migration. Refer revision history for more details in page [xix](#).

The following are the absolute new APIs added in AWR2243 device DFP.

1. [AWR_APLL_SYNTH_BW_CONTROL_SB](#)
2. [AWR_MONITOR_TYPE_TRIG_CONF_SB](#)
3. [AWR_AE_RF_MONITOR_TYPE_TRIGGER_DONE_SB](#)
4. [AWR_MONITOR_SYNTHESIZER_FREQUENCY_NONLIVE_REPORT_AE_SB](#)
5. [AWR_DEV_RF_DEBUG_SIG_SET_SB](#)
6. [AWR_DEV_CSI2_DELAY_DUMMY_CFG_SET_SB](#)
7. [AWR_ADVANCE_CHIRP_CONF_SB](#)
8. [AWR_ADVANCE_CHIRP_GENERIC_LUT_LOAD_SB](#)
9. New timing information added in page [395](#)

The following are the changes to existing APIs, backward compatibility is impacted due to these changes; however these APIs are unsupported in AWR1243 device.

1. [AWR_MONITOR_RX_IFSTAGE_CONF_SB](#)
2. [AWR_MONITOR_RX_IFSTAGE_REPORT_AE_SB](#)
3. [AWR_DIGITAL_COMP_EST_CONTROL_SB](#) (previously called [AWR_INTER_RX_GAIN_PHASE_CONTROL_SB](#))
4. [AWR_MONITOR_TX0_PHASE_SHIFTER_CONF_SB](#) (previously called [AWR_MONITOR_TX0_BPM_CONF_SB](#))
5. [AWR_MONITOR_TX1_PHASE_SHIFTER_CONF_SB](#) (previously called [AWR_MONITOR_TX1_BPM_CONF_SB](#))
6. [AWR_MONITOR_TX2_PHASE_SHIFTER_CONF_SB](#) (previously called [AWR_MONITOR_TX2_BPM_CONF_SB](#))
7. [AWR_MONITOR_TX0_PHASE_SHIFTER_REPORT_AE_SB](#) (previously called [AWR_MONITOR_TX0_BPM_REPORT_AE_SB](#))
8. [AWR_MONITOR_TX1_PHASE_SHIFTER_REPORT_AE_SB](#) (previously called [AWR_MONITOR_TX1_BPM_REPORT_AE_SB](#))
9. [AWR_MONITOR_TX2_PHASE_SHIFTER_REPORT_AE_SB](#) (previously called [AWR_MONITOR_TX2_BPM_REPORT_AE_SB](#))

The following are the updates to existing APIs in 'reserved' fields, backward compatibility is not impacted due to these changes.

1. Updated MISC_FUNC_CTRL in [AWR_RF_TEST_SOURCE_CONFIG_SET_SB](#)
2. Updated ANA_MONITORING_ENABLES and LDO_VMON_SC_MONITORING_EN in [AWR_MONITOR_ANALOG_ENABLES_CONF_SB](#)
3. Added new fields in [AWR_MONITOR_TX0_INTERNAL_ANALOG_SIGNALS_CONF_SB](#)
4. Added new fields in [AWR_MONITOR_TX1_INTERNAL_ANALOG_SIGNALS_CONF_SB](#)
5. Added new fields in [AWR_MONITOR_TX2_INTERNAL_ANALOG_SIGNALS_CONF_SB](#)
6. Added new fields in [AWR_MONITOR_TX0_INTERNAL_ANALOG_SIGNALS_REPORT_AE_SB](#)
7. Added new fields in [AWR_MONITOR_TX0_INTERNAL_ANALOG_SIGNALS_REPORT_AE_SB](#)
8. Added new fields in [AWR_MONITOR_TX0_INTERNAL_ANALOG_SIGNALS_REPORT_AE_SB](#)
9. Updates to [AWR_CHAN_CONF_SET_SB](#)
10. Updates to [API AWR_CAL_DATA_SAVE_SB](#)
11. Updates to [AWR_PROFILE_CONF_SET_SB](#)
12. Added new fields in [AWR_CALIB_MON_TIME_UNIT_CONF_SB](#)
13. Added new fields in [AWR_RUN_TIME_CALIBRATION_CONF_AND_TRIGGER_SB](#)
14. Updates to [AWR_RF_BOOTUPBIST_STATUS_GET_SB](#)
15. Updates to [AWR_AE_DEV_RFPOWERUPDONE](#)
16. Updates to [AWR_MONITOR_RF_DIG_LATENTFAULT_REPORT_AE_SB](#)
17. Added new fields in [AWR_MONITOR_SYNTHESIZER_FREQUENCY_CONF_SB](#)
18. Added new fields in [AWR_DEV_CSI2_CFG_SET_SB](#)
19. Updates to [AWR_LOOPBACK_BURST_CONF_SET_SB](#)
20. Updates to [AWR_MONITOR_PLL_CONTROL_VOLTAGE_REPORT_AE_SB](#)
21. Updates to [AWR_BPM_CHIRP_CONF_SET_SB](#)
22. Updates to [AWR_RF_RADAR_MISC_CTL_SB](#)
23. Updates to [AWR_ADVANCED_FRAME_CONF_SB](#)
24. Updates to [AWR_FRAME_CONF_SET_SB](#)
25. Added new fields in [AWR_MONITOR_TX_GAIN_PHASE_MISMATCH_REPORT_AE_SB](#)
26. Added new fields in [AWR_FRAMESTARTSTOP_CONF_SB](#)
27. Added new fields in [AWR_AE_RF_CPUFAULT_SB](#)
28. Updates to [AWR_MONITOR_RX_GAIN_PHASE_REPORT_AE_SB](#)
29. Updates to [AWR_AE_MSS_CPUFAULT_SB](#)
30. Updates to [AWR_RF_DEVICE_CFG_SB](#)
31. Updates to [AWR_MONITOR_TX_GAIN_PHASE_MISMATCH_CONF_SB](#)
32. Updates to [AWR_MONITOR_DUAL_CLOCK_COMP_CONF_SB](#)
33. Updates to [AWR_MONITOR_DUAL_CLOCK_COMP_REPORT_AE_SB](#)
34. Updates to [AWR_MSS_LATENTFAULT_TEST_CONF_SB](#)
35. Updates to [AWR_AE_MSS_LATENTFAULT_TESTREPORT_SB](#)
36. Updates to [AWR_AE_DEV_MSSPOWERUPDONE_SB](#)

IMPORTANT NOTICE

Texas Instruments Incorporated ("TI") technical, application or other design advice, services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using any particular TI Resource in any way, you (individually or, if you are acting on behalf of a company, your company) agree to use it solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources.

You understand and agree that you remain responsible for using your independent analysis, evaluation and judgment in designing your applications and that you have full and exclusive responsibility to assure the safety of your applications and compliance of your applications (and of all TI products used in or for your applications) with all applicable regulations, laws and other applicable requirements. You represent that, with respect to your applications, you have all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. You agree that prior to using or distributing any applications that include TI products, you will thoroughly test such applications and the functionality of such TI products as used in such applications. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

You are authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING TI RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY YOU AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

You agree to fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of your noncompliance with the terms and provisions of this Notice.

This Notice applies to TI Resources. Additional terms apply to the use and purchase of certain types of materials, TI products and services. These include; without limitation, TI's standard terms for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>), evaluation modules, and samples (<http://www.ti.com/sc/docs/sampterm.htm>).
